

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# NTC thermistors for temperature measurement

Leaded NTC thermistors, lead spacing 5 mm

Series/Type: B57885S

Date: January 2018

© EPCOS AG 2018. Reproduction, publication and dissemination of this publication, enclosures hereto and the information contained therein without EPCOS' prior express consent is prohibited.

EPCOS AG is a TDK Group Company.

#### Leaded NTC thermistors, lead spacing 5 mm

S885

#### **Applications**

Temperature measurement and compensation

#### **Features**

- High measuring accuracy
- Cost-effective
- Rugged design, epoxy encapsulation
- Tinned copper leads
- Lead spacing 5 mm

# **Delivery mode**

Bulk (standard), cardboard tape, reeled or in Ammo pack on request

#### **Dimensional drawing**

Dimensions in mm Approx. weight 130 mg

#### General technical data

| Climatic category             | (IEC 60068-1) |                      | 55/155/56  |      |
|-------------------------------|---------------|----------------------|------------|------|
| Max. power                    | (at 25 °C)    | P <sub>25</sub>      | 100        | mW   |
| Resistance tolerance          |               | $\Delta R_R/R_R$     | ±1, ±3, ±5 | %    |
| Rated temperature             |               | T <sub>R</sub>       | 25         | °C   |
| Dissipation factor            | (in air)      | $\delta_{\text{th}}$ | approx. 4  | mW/K |
| Thermal cooling time constant | (in air)      | $\tau_{\rm c}$       | approx. 10 | s    |
| Heat capacity                 |               | $C_{th}$             | approx. 40 | mJ/K |

## Electrical specification and ordering codes

| R <sub>25</sub> | No. of R/T     | B <sub>25/100</sub> | Ordering code   |
|-----------------|----------------|---------------------|-----------------|
| Ω               | characteristic | K                   |                 |
| 2.1 k           | 1008           | 3560 ±1%            | B57885S0212+000 |

<sup>1)</sup> Self heating of the NTC thermistor must not exceed 0.2 K, steady state. Test conditions deviating from AEC-Q200, Rev. D.

#### Note

- Contact of NTC thermistors with any liquids and solvents shall be prevented. It must be ensured that no water enters the NTC thermistors (e.g. through plug terminals).
- Avoid dewing and condensation unless thermistor is specified for these conditions.

<sup>2)</sup> Deviating from AEC-Q200, Rev. D.

#### **Mounting instructions**

#### 1 Soldering

#### 1.1 Leaded NTC thermistors

Leaded NTC thermistors, lead spacing 5 mm

Leaded thermistors comply with the solderability requirements specified by CECC.

When soldering, care must be taken that the NTC thermistors are not damaged by excessive heat. The following maximum temperatures, maximum time spans and minimum distances have to be observed:

|                          | Dip soldering | Iron soldering              |
|--------------------------|---------------|-----------------------------|
| Bath temperature         | max. 260 °C   | max. 360 $^{\circ}\text{C}$ |
| Soldering time           | max. 4 s      | max. 2 s                    |
| Distance from thermistor | min. 6 mm     | min. 6 mm                   |

Under more severe soldering conditions the resistance may change.

#### 1.1.1 Wave soldering

Temperature characteristic at component terminal with dual wave soldering

#### 1.2 Leadless NTC thermistors

In case of NTC thermistors without leads, soldering is restricted to devices which are provided with a solderable metallization. The temperature shock caused by the application of hot solder may produce fine cracks in the ceramic, resulting in changes in resistance.

To prevent leaching of the metallization, solder with silver additives or with a low tin content

| Temperature measurement and compensation |
|--|
|--|

#### Leaded NTC thermistors, lead spacing 5 mm

S885

should be used. In addition, soldering methods should be employed which permit short soldering times.

#### 1.3 SMD NTC thermistors

SMD NTC thermistors can be provided with a nickel barrier termination or on special request with silver-palladium termination. The use of no-clean solder products is recommended. In any case mild, non-activated fluxes should be used. Flux residues after soldering should be minimized.

- SMD NTCs with AgPd termination are not approved for lead-free soldering.
- Nickel barrier termination

Figure 1
SMD NTC thermistors, structure of nickel barrier termination

The nickel barrier layer of the silver/nickel/tin termination (see figure 1) prevents leaching of the silver base metallization layer. This allows great flexibility in the selection of soldering parameters.

The tin prevents the nickel layer from oxidizing and thus ensures better wetting by the solder. The nickel barrier termination is tested for all commonly-used soldering methods according to IEC 60068-2-58. Insufficient preheating may cause ceramic cracks. Rapid cooling by dipping in solvent is not recommended.

The following test and process conditions apply for nickel barrier termination.

S885

#### 1.3.1 Solderability (test to IEC 60068-2-58)

Temperature measurement and compensation

Leaded NTC thermistors, lead spacing 5 mm

Preconditioning: Immersion into flux F-SW 32.

Evaluation criterion: Wetting of soldering areas ≥95%.

| Solder                       | Bath temperature (°C) | Dwell time (s) |
|------------------------------|-----------------------|----------------|
| SnPb 60/40                   | 215 ±3                | 3 ±0.3         |
| SnAg (3.0 4.0), Cu (0.5 0.9) | 245 ±3                | 3 ±0.3         |

#### 1.3.2 Resistance to soldering heat (test to IEC 60068-2-58)

Preconditioning: Immersion into flux F-SW 32. Evaluation criterion: Leaching of side edges ≤1/3.

| Solder                       | Bath temperature (°C) | Dwell time (s) |
|------------------------------|-----------------------|----------------|
| SnPb 60/40                   | 260 ±5                | 10 ±1          |
| SnAg (3.0 4.0), Cu (0.5 0.9) | 260 ±5                | 10 ±1          |

#### 1.3.3 Reflow soldering

Temperature ranges for reflow soldering acc. to IEC 60068-2-58 recommendations.

| 1206/3216         | 1.8 | 1.2 | 4.5 |

#### 2 Conductive adhesion

An alternative to soldering for silver-palladium terminated components is the gluing of thermistors with conductive adhesives. The benefit of this method is that it involves no thermal stress. The adhesives used must be chemically inert.

#### 3 Clamp contacting

Pressure contacting by means of clamps is particularly suitable for applications involving frequent switching and high turn-on powers.

#### Robustness of terminations (leaded types)

The leads meet the requirements of IEC 60068-2-21. They may not be bent closer than 4 mm from the solder joint on the thermistor body or from the point at which they leave the feedthroughs. During bending, any mechanical stress at the outlet of the leads must be removed. The bending radius should be at least 0.75 mm.

Torsional strength: Test Uc: severity 2

The lead is bent by 90° at a distance of 6 to 6.5 mm from the thermistor body.

The bending radius of the leads should be approx. 0.75 mm. Two torsions of

180° each (severity 2).

When subjecting leads to mechanical stress, the following should be observed:

Tensile stress on leads

During mounting and operation tensile forces on the leads are to be avoided.

Bending of leads

Bending of the leads directly on the thermistor body is not permissible.

A lead may be bent at a minimum distance of twice the wire's diameter +4 mm from the solder joint on the thermistor body. During bending the wire must be mechanically relieved at its outlet. The bending radius should be at least 0.75 mm.

# 5 Sealing and potting

Sealing or potting processes can affect the reliability of the component.

When thermistors are sealed, potted or overmolded, there must be no mechanical stress caused by thermal expansion during the production process (curing / overmolding process) and during later operation. The upper category temperature of the thermistor must not be exceeded. Ensure that the materials used (sealing / potting compound and plastic material) are chemically neutral. As thermistors are temperature sensitive components it should be considered that molding can affect the thermal surrounding and may influence e.g. the response time.

Extensive testing is encouraged in order to determine whether overmolding or potting influences the functionality and/ or reliability of the component.

#### 6 Cleaning

Cleaning processes can affect the reliability of the component.

If cleaning is necessary, mild cleaning agents are recommended. Cleaning agents based on water are not allowed. Washing processes may damage the product due to the possible static or cyclic mechanical loads (e.g. ultrasonic cleaning). They may cause cracks which might lead to reduced reliability and/ or lifetime.

#### 7 Storage

In order to maintain their solderability, thermistors must be stored in a non-corrosive atmosphere. Humidity, temperature and container materials are critical factors.

Do not store SMDs where they are exposed to heat or direct sunlight. Otherwise, the packing material may be deformed or SMDs may stick together, causing problems during mounting. After opening the factory seals, such as polyvinyl-sealed packages, use the SMDs as soon as possible.

The components should be left in the original packing. Touching the metallization of unsoldered thermistors may change their soldering properties.

Storage temperature: -25 °C up to 45 °C Relative humidity (without condensation):  $\leq 75\%$  annual mean

<95%, maximum 30 days per annum

Solder the thermistors listed in this data book after shipment from EPCOS within the time specified:

SMDs with AgPd termination: 6 months
SMDs with nickel barrier termination: 12 months
Leadless components: 12 months
Leaded components: 24 months

#### Leaded NTC thermistors, lead spacing 5 mm

S885

#### 8 Placement and orientation of SMD NTC thermistors on PCB

#### a) Component placement

It is recommended that the PC board should be held by means of some adequate supporting pins such as shown left to prevent the SMDs from being damaged or cracked.

#### b) Cracks

When placing a component near an area which is apt to bend or a grid groove on the PC board, it is advisable to have both electrodes subjected to uniform stress, or to position the component's electrodes at right angles to the grid groove or bending line (see c) Component orientation).

# c) Component orientation

Choose a mounting position that minimizes the stress imposed on the chip during flexing or bending of the board.

S885

#### Cautions and warnings

#### General

See "Important notes" on page 2.

#### Storage

- Store thermistors only in original packaging. Do not open the package prior to processing.
- Storage conditions in original packaging: storage temperature −25 °C ... +45 °C, relative humidity ≤75% annual mean, <95% maximum 30 days per annum, dew precipitation is inadmissible.</p>
- Do not store thermistors where they are exposed to heat or direct sunlight. Otherwise, the packing material may be deformed or components may stick together, causing problems during mounting.
- Avoid contamination of thermistor surface during storage, handling and processing.
- Avoid storage of thermistors in harmful environments like corrosive gases (SO<sub>x</sub>, Cl etc).
- Use the components as soon as possible after opening the original packaging.
- Solder thermistors within the time specified after shipment from EPCOS.
  For leaded components this is 24 months, for SMD components with nickel barrier termination 12 months, for leadless components this is 12 months, for SMD components with AgPd termination 6 months.

#### Handling

- NTC thermistors must not be dropped. Chip-offs or any other damage must not be caused during handling of NTCs.
- Do not touch components with bare hands. Gloves are recommended.
- Avoid contamination of thermistor surface during handling.
- Washing processes may damage the product due to the possible static or cyclic mechanical loads (e.g. ultrasonic cleaning). They may cause cracks to develop on the product and its parts, which might lead to reduced reliability or lifetime.

#### Bending / twisting leads

A lead (wire) may be bent at a minimum distance of twice the wire's diameter plus 4 mm from the component head or housing. When bending ensure the wire is mechanically relieved at the component head or housing. The bending radius should be at least 0.75 mm.

#### Soldering

- Use resin-type flux or non-activated flux.
- Insufficient preheating may cause ceramic cracks.
- Rapid cooling by dipping in solvent is not recommended.
- Complete removal of flux is recommended.

Temperature measurement and compensation

B57885S

#### Leaded NTC thermistors, lead spacing 5 mm

S885

#### Mounting

- Ensure that no thermo-mechanical stress occurs due to production processes (curing or overmolding processes) when thermistors are sealed, potted or overmolded or during their subsequent operation. The maximum temperature of the thermistor must not be exceeded. Ensure that the materials used (sealing/potting compound and plastic material) are chemically neutral.
- Electrodes/contacts must not be scratched or damaged before/during/after the mounting process.
- Contacts and housing used for assembly with the thermistor must be clean before mounting.
- Ensure that adjacent materials are designed for operation at temperatures comparable to the surface temperature of the thermistor. Be sure that surrounding parts and materials can withstand the temperature.
- Avoid contamination of the thermistor surface during processing.
- The connections of sensors (e.g. cable end, wire end, plug terminal) may only be exposed to an environment with normal atmospheric conditions.
- Tensile forces on cables or leads must be avoided during mounting and operation.
- Bending or twisting of cables or leads directly on the thermistor body is not permissible.
- Avoid using chemical substances as mounting aids. It must be ensured that no water or other liquids enter the NTC thermistors (e.g. through plug terminals). In particular, water based substances (e.g. soap suds) must not be used as mounting aids for sensors.
- The use of no-clean solder products is recommended. In any case mild, non-activated fluxes should be used. Flux residues after soldering should be minimized.

#### Operation

- Use thermistors only within the specified operating temperature range.
- Use thermistors only within the specified power range.
- Environmental conditions must not harm the thermistors. Only use the thermistors under normal atmospheric conditions or within the specified conditions.
- Contact of NTC thermistors with any liquids and solvents shall be prevented. It must be ensured that no water enters the NTC thermistors (e.g. through plug terminals). For measurement purposes (checking the specified resistance vs. temperature), the component must not be immersed in water but in suitable liquids (e.g. perfluoropolyethers such as Galden).
- Avoid dewing and condensation unless thermistor is specified for these conditions.
- Bending or twisting of cables and/or wires is not permissible during operation of the sensor in the application.
- Be sure to provide an appropriate fail-safe function to prevent secondary product damage caused by malfunction.

This listing does not claim to be complete, but merely reflects the experience of EPCOS AG.

#### Display of ordering codes for EPCOS products

The ordering code for one and the same EPCOS product can be represented differently in data

| ture measurement an |  |
