

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Operational Amplifiers Series

Automotive High Speed Operational Amplifiers

BA3472Yxxx-C, BA3474YFV-C, BA3472WFV-C, BA3474WFV-C

● **General Description**

BA3472Y, BA3474Y, BA3472W, and BA3474W integrate two or four independent Op-amps on a single chip. These Op-Amps can operate from +3V to +36V (single power supply) with a high slew rate (10V/μs) and high-gain bandwidth (4MHz) characteristics.

● **Features**

- Single or dual power supply operation
- Wide operating supply voltage
- Standard Op-Amp Pin-assignments
- High open-loop voltage gain
- Internal ESD protection circuit
- Common-mode Input Voltage Range includes ground level, allowing direct ground sensing
- Wide output voltage range
- AEC-Q100 Qualified

● **Key Specifications**

- Wide Operating Supply Voltage:
 - Single supply +3.0V to +36.0V
 - Dual supply ±1.5V to ±18.0V
- Wide Temperature Range: -40°C to +125°C
- Input Offset Voltage:

BA3472Y, BA3474Y	10mV (Max.)
BA3472W, BA3474W	7.5mV (Max.)
- Low Input Offset Current: 6nA (Typ.)
- Low Input Bias Current: 100nA (Typ.)
- Wide Output Voltage Range:
 - VEE+0.3V to VCC-1.0V(Typ.)
 - (VCC-VEE=30V)
- High Slew Rate: 10V/μs(Typ.)
- Gain Band Width: 4MHz(Typ.)

● **Packages**

Package	W(Typ.) x D(Typ.) x H(Max.)
SOP8	5.00mm x 6.20mm x 1.71mm
SSOP-B8	3.00mm x 6.40mm x 1.35mm
MSOP8	2.90mm x 4.00mm x 0.90mm
SSOP-B14	5.00mm x 6.40mm x 1.35mm

● **Application**

- Engine Control Unit
- Electric Power Steering (EPS)
- Anti-Lock Braking System (ABS)
- All automotive application

● **Simplified schematic**

● Absolute Maximum Ratings (Ta=25°C)

OBA3472Y, BA3472W, BA3474Y, BA3474W

Parameter	Symbol	Ratings	Unit	
Supply Voltage	VCC-VEE	+36	V	
Power dissipation	Pd	SOP8	1075 ^{*1*5}	mW
		SSOP-B8	835 ^{*1*3}	
		MSOP8	750 ^{*3*5}	
		SSOP-B14	1350 ^{*2*3}	
Differential Input Voltage ^{*6}	Vid	+36	V	
Input Common-mode Voltage Range	Vicm	(VEE-0.3) to VEE+36	V	
Operating Supply Voltage	Vopr	+3.0Vto+36.0V (±1.5Vto±18.0V)	V	
Operating Temperature	Topr	-40 to +125	°C	
Storage Temperature	Tstg	-55 to +150	°C	
Maximum Junction Temperature	Tjmax	+150	°C	

Note Absolute maximum rating item indicates the condition which must not be exceeded.

Application of voltage in excess of absolute maximum rating or use out absolute maximum rated temperature environment may cause deterioration of characteristics.

*1 To use at temperature above Ta=25°C reduce 8.6mW/°C.

*2 To use at temperature above Ta=25°C reduce 6.7mW/°C.

*3 To use at temperature above Ta=25°C reduce 6.0mW/°C.

*4 To use at temperature above Ta=25°C reduce 10.8mW/°C.

*5 Mounted on a FR4 glass epoxy 4 layers PCB 70mm×70mm×1.6mm (occupied copper area: 70mm×70mm).

*6 The voltage difference between inverting input and non-inverting input is the differential input voltage. Then input terminal voltage is set to more than VEE.

*16 Absolute value

*17 Current direction: Since first input stage is composed with PNP transistor, input bias current flows out of IC.

*18 Under high temperatures, please consider the power dissipation when selecting the output current.

When the output terminal is continuously shorted the output current reduces the internal temperature by flushing.

Description of Electrical Characteristics

Described below are descriptions of the relevant electrical terms used in this datasheet. Items and symbols used are also shown. Note that item name and symbol and their meaning may differ from those on another manufacturer's document or general document.

1. Absolute maximum ratings

Absolute maximum rating items indicate the condition which must not be exceeded. Application of voltage in excess of absolute maximum rating or use out of absolute maximum rated temperature environment may cause deterioration of characteristics.

1.1 Power supply voltage (VCC-VEE)

Indicates the maximum voltage that can be applied between the positive power supply terminal and negative power supply terminal without deterioration or destruction of characteristics of internal circuit.

1.2 Differential input voltage (V_{id})

Indicates the maximum voltage that can be applied between non-inverting and inverting terminals without damaging the IC.

1.3 Input common-mode voltage range (V_{icm})

Indicates the maximum voltage that can be applied to the non-inverting and inverting terminals without deterioration or destruction of electrical characteristics. Input common-mode voltage range of the maximum ratings does not assure normal operation of IC. For normal operation, use the IC within the input common-mode voltage range characteristics.

1.4 Power dissipation (P_d)

Indicates the power that can be consumed by the IC when mounted on a specific board at the ambient temperature 25°C (normal temperature). As for package product, P_d is determined by the temperature that can be permitted by the IC in the package (maximum junction temperature) and the thermal resistance of the package.

2. Electrical characteristics

2.1 Input offset voltage (V_{io})

Indicates the voltage difference between non-inverting terminal and inverting terminals. It can be translated into the input voltage difference required for setting the output voltage at 0 V.

2.2 Input offset current (I_{io})

Indicates the difference of input bias current between the non-inverting and inverting terminals.

2.3 Input bias current (I_b)

Indicates the current that flows into or out of the input terminal. It is defined by the average of input bias currents at the non-inverting and inverting terminals.

2.4 Circuit current (I_{CC})

Indicates the current that flows within the IC under specified no-load conditions.

2.5 High level output voltage/low level output voltage (V_{OH}/V_{OL})

Indicates the voltage range of the output under specified load condition. It is typically divided into high-level output voltage and low-level output voltage. High-level output voltage indicates the upper limit of output voltage while Low-level output voltage indicates the lower limit.

2.6 Large signal voltage gain (A_v)

Indicates the amplifying rate (gain) of output voltage against the voltage difference between non-inverting terminal and inverting terminal. It is normally the amplifying rate (gain) with reference to DC voltage.

$$A_v = (\text{Output voltage fluctuation}) / (\text{Input offset fluctuation})$$

2.7 Input common-mode voltage range (V_{icm})

Indicates the input voltage range where IC normally operates.

2.8 Common-mode rejection ratio (CMRR)

Indicates the ratio of fluctuation of input offset voltage when the input common mode voltage is changed. It is normally the fluctuation of DC.

$$\text{CMRR} = (\text{Change of Input common-mode voltage}) / (\text{Input offset fluctuation})$$

2.9 Power supply rejection ratio (PSRR)

Indicates the ratio of fluctuation of input offset voltage when supply voltage is changed. It is normally the fluctuation of DC.

$$\text{PSRR} = (\text{Change of power supply voltage}) / (\text{Input offset fluctuation})$$

2.10 Output source current/ output sink current (IOH / IOL)

The maximum current that can be output from the IC under specific output conditions. The output source current indicates the current flowing out from the IC, and the output sink current indicates the current flowing into the IC.

2.11 Gain Band Width (GBW)

The product of the open-loop voltage gain and the frequency at which the voltage gain decreases 6dB/octave.

2.12 Slew rate (SR)

Indicates the ratio of the change in output voltage with time when a step input signal is applied.

2.13 Channel separation (CS)

Indicates the fluctuation in the output voltage of the driven channel with reference to the change of output voltage of the channel which is not driven.

●Application Information

NULL method condition for Test circuit1

VCC, VEE, EK, Vicm Unit : V

Parameter	VF	S1	S2	S3	VCC	VEE	EK	Vicm	Calculation
Input Offset Voltage	VF1	ON	ON	OFF	15	-15	0	0	1
Input Offset Current	VF2	OFF	OFF	OFF	15	-15	0	0	2
Input Bias Current	VF3	OFF	ON	OFF	15	-15	0	0	3
	VF4	ON	OFF						
Large Signal Voltage Gain	VF5	ON	ON	ON	15	-15	+10	0	4
	VF6				15	-15	-10	0	
Common-mode Rejection Ratio (Input Common-mode Voltage Range)	VF7	ON	ON	OFF	15	-15	0	-15	5
	VF8				15	-15	0	13	
Power Supply Rejection Ratio	VF9	ON	ON	OFF	2	-2	0	0	6
	VF10				18	-18	0	0	

—Calculation—

1. Input Offset Voltage (Vio)

$$V_{io} = \frac{|VF1|}{1+RF/RS} [V]$$

2. Input Offset Current (Iio)

$$I_{io} = \frac{|VF2 - VF1|}{R_i \times (1 + RF/RS)} [A]$$

3. Input Bias Current (Ib)

$$I_b = \frac{|VF4 - VF3|}{2 \times R_i \times (1 + RF/RS)} [A]$$

4. Large Signal Voltage Gain (Av)

$$A_v = 20 \times \text{Log} \frac{\Delta E_K \times (1 + RF/RS)}{|VF5 - VF6|} [dB]$$

5. Common-mode Rejection Ratio (CMRR)

$$CMRR = 20 \times \text{Log} \frac{\Delta V_{icm} \times (1 + RF/RS)}{|VF8 - VF7|} [dB]$$

6. Power Supply Rejection Ratio (PSRR)

$$PSRR = 20 \times \text{Log} \frac{\Delta V_{cc} \times (1 + RF/RS)}{|VF10 - VF9|} [dB]$$

●Examples of circuit

○Voltage follower

Figure 52. Voltage follower circuit

Voltage gain is 0dB.

Using this circuit, the output voltage (OUT) is configured to be equal to the input voltage (IN). This circuit also stabilizes the output voltage (OUT) due to high input impedance and low output impedance. Computation for output voltage (OUT) is shown below.

$$\text{OUT}=\text{IN}$$

○Inverting amplifier

Figure 53. Inverting amplifier circuit

For inverting amplifier, input voltage (IN) is amplified by a voltage gain and depends on the ratio of R1 and R2. The out-of-phase output voltage is shown in the next expression

$$\text{OUT}=-\left(\frac{\text{R2}}{\text{R1}}\right) \cdot \text{IN}$$

This circuit has input impedance equal to R1.

○Non-inverting amplifier

Figure 54. Non-inverting amplifier circuit

For non-inverting amplifier, input voltage (IN) is amplified by a voltage gain, which depends on the ratio of R1 and R2. The output voltage (OUT) is in-phase with the input voltage (IN) and is shown in the next expression.

$$\text{OUT}=\left(1+\frac{\text{R2}}{\text{R1}}\right) \cdot \text{IN}$$

Effectively, this circuit has high input impedance since its input side is the same as that of the operational amplifier.

●Power Dissipation

Power dissipation (total loss) indicates the power that the IC can consume at Ta=25°C (normal temperature). As the IC consumes power, it heats up, causing its temperature to be higher than the ambient temperature. The allowable temperature that the IC can accept is limited. This depends on the circuit configuration, manufacturing process, and consumable power.

Power dissipation is determined by the allowable temperature within the IC (maximum junction temperature) and the thermal resistance of the package used (heat dissipation capability). Maximum junction temperature is typically equal to the maximum storage temperature. The heat generated through the consumption of power by the IC radiates from the mold resin or lead frame of the package. Thermal resistance, represented by the symbol θ_{ja} °C/W, indicates this heat dissipation capability. Similarly, the temperature of an IC inside its package can be estimated by thermal resistance.

Figure 55(a) shows the model of the thermal resistance of the package. The equation below shows how to compute for the Thermal resistance (θ_{ja}), given the ambient temperature (Ta), junction temperature (Tj), and power dissipation (Pd).

$$\theta_{ja} = (T_{jmax} - T_a) / P_d \quad \text{°C/W} \quad \dots \dots (I)$$

The Derating curve in Figure 55(b) indicates the power that the IC can consume with reference to ambient temperature. Power consumption of the IC begins to attenuate at certain temperatures. This gradient is determined by Thermal resistance (θ_{ja}), which depends on the chip size, power consumption, package, ambient temperature, package condition, wind velocity, etc. This may also vary even when the same of package is used. Thermal reduction curve indicates a reference value measured at a specified condition. Figure 56(c) and 56(d) shows an example of the derating curve for BA3472Y, BA3472W, BA3474Y and BA3474W.

Figure 55. Thermal resistance and derating curve

(*19)	(*20)	(*21)	(*22)	Unit
8.6	6.7	6.0	10.8	mW/°C

When using the unit above Ta=25°C, subtract the value above per degree°C.
 Mounted on a FR4 glass epoxy 4 layers PCB 70mm × 70mm × 1.6mm (occupied copper area : 70mm × 70mm).

Figure 56. Derating curve

<Reference>

When the part is mounted on FR4 glass epoxy 4 layers PCB 70mm × 70mm × 1.6mm (occupied copper area : 70mm × 70mm).
 SSOP-B8 package : Pd at 125°C is 165mW so Vcc has to be below 27V.
 MSOP8 package : Pd at 125°C is 150mW so Vcc has to be below 25V.
 SSOP-B14 package : Pd at 125°C is 270mW so Vcc has to be below 22V.
