

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Quasi-Resonant Control DC/DC converter and Power Factor Correction converter IC for AC/DC Converter

BM1050AF-G

●General Description

BM1050AF is compounded LSI of Power Factor Correction converter (PFC) for harmonic solution and DC/DC converter (DC/DC). Because DC/DC operates on Quasi-resonant method, DC/DC contributes to Low EMI.

BM1050AF built in a HV starter circuit that tolerates 650V. Because of putting the current sense resistors externally both the PFC part and the DC/DC part, IC enables power supply design free.

In the PFC part, IC adopts peak current control operation. Suitable application is proposed by a various protection circuit, such as the multiplier with a revision circuit on the AC voltage falls, the load regulation revision circuit, and the maximum power feed-forward circuit, etc. Moreover, the frequency hopping function is built in and it contributes to low EMI.

The Quasi-resonant system of a DC/DC part contributes to low EMI because PFC operates by soft switching.

A burst mode is built in, so the power is reduced at light load. Various protection functions, such as a soft start function, a burst function, an over-current limiting for every cycle, overvoltage protection, and over current protection, are built in. The pin for communicated control with a controller and the external stop pin are prepared; it proposes the system that can be adapted for various applications.

●Basic specifications

- Operating Power Supply Voltage Range:
VCC : 8.5 to 24.0V
- Operating Current:
QR ON (PFC OFF) : 1.20mA(pulse on)
QR ON (PFC OFF) : 1.00mA(pulse off)
QR ON (PFC ON) : 1.80mA(pulse on)
- Oscillation Frequency QR part :120kHz(FB=2.0V typ)
- Operating Temperature: -40°C to +85°C
-

●Typical Application Circuit(s)

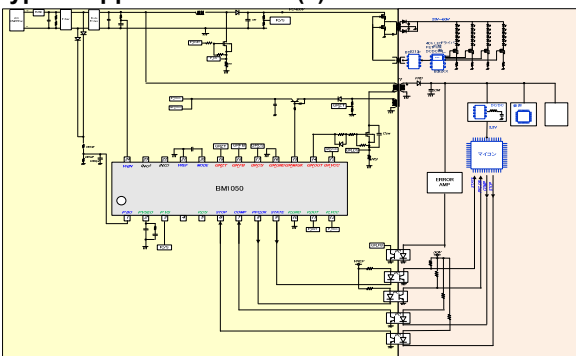

Figure 1. Application circuit

●Features

- Quasi-resonant circuit + PFC circuit
- Built-in HV Starter circuit
- Low consumption current (typ.10uA) when starter circuit is OFF.
- Quasi resonant circuit
Max operating frequency(120kHz)
Frequency reduction function
Over-current limiting variable function
Pulse-by-pulse over-current protection circuit
Built-in Soft start
Voltage protection function (brown out) during low input
ZT pin Over Voltage Protection
Output overload protection (auto recovery /latch switching enabled)
250nsec Leading-Edge Blanking
- Power Factor Correction circuit
Peak current control (65kHz)
Frequency hopping function
Per-cycle over current protection circuit
Maximum power revision
the multiplier with a revision circuit when the AC voltage falls
the load change measure circuit
- Selectable protection method by LATCH/AUTOR terminal.
LATCH/AUTOR=H : Latch
LATCH/AUTOR=L : Auto recovery
- External stop function (COMP pin)
- AC input voltage stop detected function (ACDET)
- Built-in PFC stop terminal (PFCON/OFF)

●Package(s)

- SOP24 15.0mm × 5.40mm × 1.80mm pitch1.27mm
(Typ.) (Typ.) (TYP.) (TYP.)

●Applications

- TV, AC adapters, printers, LED lighting

● Absolute Maximum Ratings (Ta = 25°C)

Parameter	Symbol	Rating	Unit	Conditions
Maximum applied voltage 1	V _{max1}	650	V	VH_IN
Maximum applied voltage 2	V _{max2}	30	V	VCC, QR_SEL
Maximum applied voltage 3	V _{max3}	5.5	V	P_BO, P_VSEO, P_VS, P_BOPK P_CS, PFCON/OFF, COMP, ACDET, ACTIMER, QR_CS, QR_ZT, QR_FB, LATCH/AUTOR, VREF
Maximum applied voltage 4	V _{max4}	15	V	GCLAMP, P_OUT, QR_OUT
output peak current 1	I _{OH}	-0.5	A	QR_OUT, P_OUT
output peak current 2	I _{OL}	1.0	A	QR_OUT, P_OUT
QR_ZT pin current 1	I _{SZT1}	-2.0	mA	
QR_ZT pin current 2	I _{SZT2}	3.0	mA	
Allowable dissipation	P _d	687.6 (Note1)	mW	
Operating temperature range	T _{opr}	-40 ~ +85	°C	
Maximum junction temperature	T _{jmax}	150	°C	
Storage temperature range	T _{str}	-55 ~ +150	°C	

(Note1) When mounted (on 70 mm × 70 mm, 1.6 mm thick, glass epoxy on single-layer substrate).
Reduce to 5.5 mW/°C when Ta = 25°C or above.

● Operating Conditions (Ta = 25°C)

Parameter	Symbol	Rating	Unit	Conditions
Power supply voltage range 1	VCC	8.5~24.0	V	VCC
Power supply voltage range 2	VH_IN	80~600	V	VH_IN
Power supply voltage range 3	P_BO	0.0~1.8	V	P_BO

●Electrical Characteristics (Unless otherwise noted, Ta=25, VH_IN=320Vdc, VCC=12V)

Parameter	Symbol	Specifications			Unit	Conditions
		Minimum	Standard	Maximum		
[Circuit current]						
Circuit current (ON) 1	I_{ON1}	0.700	1.200	1.700	mA	VCC=12.0V (QR=ON, PFC=OFF) QR_FB=1.0V (during pulse operation)
Circuit current (ON) 2	I_{ON2}	0.700	1.000	1.300	mA	VCC=12.0V (QR =ON, PFC=OFF) QR_FB=VREF (during pulse operation when OFF)
Circuit current (ON) 3	I_{ON3}	0.800	1.800	2.800	mA	VCC=12.0V (QR =ON, PFC=ON) QR_FB=1.0V (during pulse operation)
[Start circuit Block]						
Start current 1	I_{START1}	0.100	0.500	1.000	mA	VCC= 0V
Start current 2	I_{START2}	1.000	3.000	5.000	mA	VCC=10V
OFF Current	I_{START3}	-	10	16	uA	Input current from VH_IN terminal after releasing UVLO
VH voltage switched start current	V_{SC}	0.400	0.800	1.400	V	
[VREF Block]						
VREF output voltage	V_{REF1}	3.500	4.000	4.500	V	
VREF output capacitor	C_{REF}	0.68	1.00	2.20	uF	
GCLAMP voltage 1	GCL1	11.0	12.5	14.0	V	VCC=15V
GCLAMP voltage 2	GCL2	11.0	12.5	14.0	V	VCC=22V
VREF UVLO 1	V_{RUVLO1}	77.5 (3.100V)	87.5 (3.500V)	97.5 (3.900V)	%	When VREF rise The ratio of VREF pin voltage.
VREF UVLO 2	V_{RUVLO2}	52.5 (2.100V)	62.5 (2.500V)	72.5 (2.900V)	%	When VREF drop The ratio of VREF pin voltage.
VREF UVLO hysteresis	V_{RUVLO3}	-	25 (1.000V)	-	%	$V_{RUVLO3} = V_{RUVLO1} - V_{RUVLO2}$
VCC UVLO voltage 1	V_{UVLO1}	12.50	13.50	14.50	V	VCC rise
VCC UVLO voltage 2	V_{UVLO2}	5.50	7.00	8.50	V	VCC drop
VCC UVLO hysteresis	V_{UVLO3}	-	6.50	-	V	$V_{UVLO3} = V_{UVLO1} - V_{UVLO2}$
VCC OVP voltage 1	V_{OVP1}	24.0	27.0	30.0	V	VCC rise
VCC OVP voltage 2	V_{OVP2}	20.0	23.0	26.0	V	VCC drop
VCC OVP hysteresis	V_{OVP3}	-	4.0	-	V	$V_{OVP3} = V_{OVP1} - V_{OVP2}$
Brown out detection voltage 1	V_{BO1}	0.350	0.400	0.450	V	P_BO rise
Brown out detection voltage 2	V_{BO2}	-	0.200	-	V	P_BO drop
Brown out hysteresis	V_{BO3}	-	0.200	-	V	$V_{BO3} = V_{BO1} - V_{BO2}$
Brown out detection delay time 1	T_{BO1}	21.8	32.0	42.2	ms	Times until ACDET logic change (ACTIMER=L)
Brown out detection delay time 2	T_{BO2}	87.0	128.0	169.0	ms	Times until ACDET logic change (ACTIMER=H)
Brown out detection delay time 3	T_{BO3}	170	250	330	ms	Times until PFC and QR stop

●Electrical Characteristics (Unless otherwise noted ,Ta=25,VH_IN=320Vdc,VCC=12V)

Parameter	Symbol	Specifications			Unit	Conditions
		Minimum	Standard	Maximum		
[ACDET pin characteristics]						
ACDET pin ON resistor	R_{ACDET}	50	100	200	Ω	
[ACTIMER pin characteristics]						
ACTIMER pin input L level	$V_{ACTIMEL}$	-	-	0.3	V	
ACTIMER pin input H level	$V_{ACTIMEH}$	1.2	-	-	V	
ACTIMER pin pull-down resistor	$R_{ACTIMEH}$	165	330	500	k Ω	
[PFCON/OFF pin characteristics]						
PFCON/OFF pin input L level	$V_{PON/OFFL}$	-	-	0.3	V	PFC = ON

● I/O Equivalent Circuit Diagram

Figure 2. I/O Equivalent Circuit Diagram

Figure 3-2. Block Diagram

●Explanation of each block

(1) Starter block (24pin)

BM1050AF built in the starter circuit that withstands 650V. For that, application used the IC is enabled faster start time and low standby power. After start-up, consumption power is idling current I_{START3} (typ=10uA) only. Reference of start-up time is shown in Figure 6. It can start-up less than 0.1sec when $C_{VCC}=10\mu F$.

Figure 4. Start Circuit Block Diagram

Figure 5. Start-up current vs VCC voltage

Figure 6. Start time vs C_{VCC} (Reference values)

*Start current flows from Vh_in pin to VCC pin.

ex) When $V_{ac}=100V$; consumption power of start-up circuit only.

$$P_{VH} = 100V \cdot \sqrt{2} \cdot 10\mu A = 1.41mW$$

ex) When $V_{ac}=240V$; consumption power of start-up circuit only.

$$P_{VH} = 240V \cdot \sqrt{2} \cdot 10\mu A = 3.38mW$$

(2) Start sequence

The start sequence of IC operates DC/DC part, next PFC part (See the figure 7).

A : Input voltage V_H is applied.

B : Charge current flows from V_H_IN pin to the VCC pin capacitor. Then VCC pin voltage rises.

C : Monitor the AC voltage by P_BO pin. And confirm normal state by releasing brown out.

D :When V_{UVLO1} (typ=13.5V) < VCC pin, release the inside UVLO and ON the inside regulator VREF.

E : When V_{RUVLO1} (typ=87.5%) < VREF pin, release the inside VREFUVLO.

F : If the 'E' state continues constant period, DC/DC part starts because it recognizes normal state.

When the switching starts, VOUT voltage rises.

When the DC/DC start-up, please set external parts to be regulated output voltage within the T_{FOLP} period (64ms .typ).

[QR start-up operation]

G: This IC adjusts over current limiter of DC/DC by operation of soft start 1 against over voltage and current rising.

That term continues T_{SS1} (typ=1ms).

H: This IC adjusts over current limiter of DC/DC by operation of soft start 2 against over voltage and current rising.

Soft start 2 operation continues power limiter operation until P_VS pin voltage > V_{PFCON} (2.00V typ) and T_{SS2} (typ=4ms) .

This IC operates the state that maximum power of QR is 50% at this state.

I: If secondary voltage is setting value, QR_FB pin voltage is constant value corresponded load by current from photo coupler.

At normal state, QR_FB voltage is $QR_FB < V_{FBOLP1B}$ (2.60V typ).

[PFC start up operation]

J: At the point in I time, This IC recognizes that the part of DC/DC operation is normal, Part of PFC starts operation.

K: If P_VS pin voltage is upper V_{P_SHORT} (typ = 0.3V), this IC judges short detection normal.

L: P_VSEO voltage rises from 0V to prevent from over rising voltage and current at PFC part.

At this time P_OUT pin DUTY increase from 0% with P_VSEO voltage increasing.

Figure 7. Start sequences Timing chart

About figure7, condition is PFCON/OFF=L.

Start up operation is shown at figure8, 9 by the state shift figure.

Figure 8 is LATCH/AUTOR=L (auto return operation), and figure 9 is LATCH/AUTOR=H (LATCH operation)

(Note) When the latch mode is used, it is necessary to apply 3.5V~4.5V to VREF terminal from the outside.

Figure 8. Diagram of state machine (LATCH/AUTOR=L)

Figure 9. Diagram of state machine (LATCH/AUTOR=H)

(3) VCC protection function and VREF pin function

(3-1) VCC pin protection function(13pin)

BM1050AF built in VCC low voltage protection function of VCCUVLO (Under Voltage Lock Out) and over voltage protection function of VCC OVP (Over Voltage Protection).

This function monitors VCC pin and prevent VCC pin from destroying switching MOSFET at abnormal voltage.

VCCUVLO is auto recovery comparator that has voltage hysteresis. VCCOVP operates as latch mode comparator in the LATCH/AUTOR=H and as auto return comparator in the LATCH/AUTOR=L.

$V_{CC} < V_{LATCHOFF}$ (typ = $V_{UVLO1} - 0.5$) is condition of latch release (reset) after detection of latch operation by VCCOVP.

Refer to the operation figure10.

VCCOVP built in mask time T_{COMP} (typ=150us), in case of continuing VCCOVP 150us, operates over voltage detection.

By this function, this IC masks pin generated surge etc.

(Note) When the latch mode is used, it is necessary to apply 3.5V~4.5V to VREF terminal from the outside.

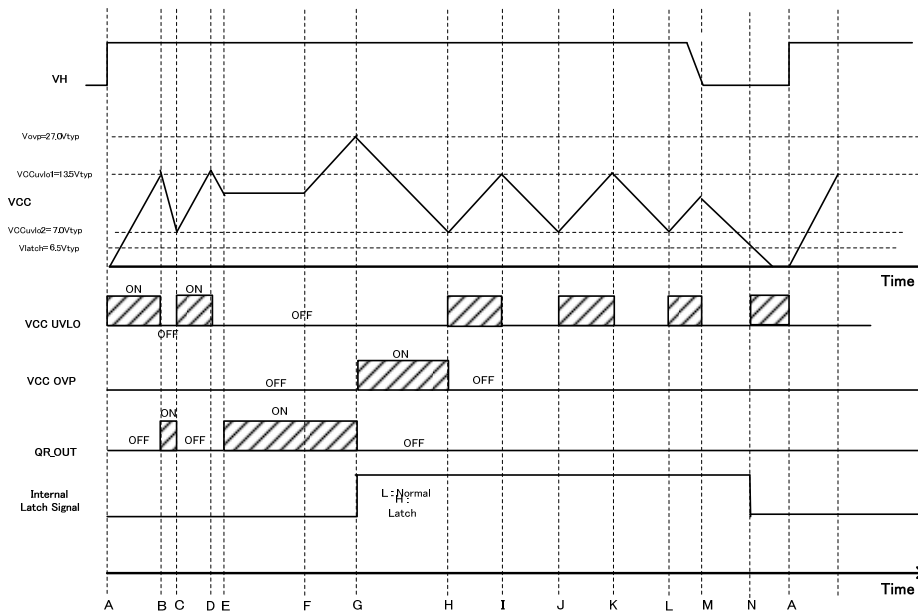

Figure10. VCC UVLO / OVP (LATCH/AUTOR=H at Latch stop)

A:VH input, VCC voltage rise

B: $V_{CC} > V_{UVLO1}$,DC/DC operation start

C: $V_{CC} < V_{UVLO2}$,DC/DC operation stop

D: $V_{CC} > V_{UVLO1}$,DC/DC operation start

E:VCC voltage decreases until starting DC/DC switching

F:VCC rise

F:When $V_{CC} > V_{OV1}$,DC/DC operation is stopped. Switching is stopped by internal latch signal.

G:Then DC/DC operation is stopped, power supply is lost from auxiliary, VCC voltage downs.

H: $V_{CC} < V_{UVLO2}$, VCC voltage rises for dropping IC's consumption current.

I: $V_{CC} > V_{UVLO1}$, this IC dose not operate DC/DC for latch operation. VCC voltage drops because of dropping of IC's consumption current.

J:same of H

K:same of I

L:same of J

M:VH is open(the state is outlet out).VCC drops.

N: $V_{CC} < V_{COMP}$, latch releases.

(3-2) VREF pin function(21pin)

VREF pin is internal regulator output pin.

The use of VREF pin is IC's internal supply and connection of LATCH/AUTOR pin changing.

This pin needs an external capacitance, please use the capacitance following table.

(Note) When the latch mode is used, it is necessary to apply 3.5V~4.5V to VREF terminal from the outside.

Table 2. VREF pin output capacitor capacitance

Parameter	Symbol	Specification			Unit	Conditions
		Minimum	Standard	Maximum		
VREF Output Capacitor	C _{REF}	0.68	1.00	2.20	uF	

(3-3) VREF pin protection function(21pin)

VREF pin built in low voltage protection function VREF UVLO (Under Voltage Protection).

This IC prevents from error operating at the time, VREF starts up and VREF is low, by this function.

Figure11. VREF UVLO Function

(3-4)Blown out function(1 pin)

BM1050AF built in blown out function. This function is that this IC stops DCDC operating at the time when input AC voltage is low. Show the example figure12. This IC divides input voltage by the resistance, and input P_BO pin.

This IC detects from circuit normal state, and starts DC/DC operation the time when P_BO pin exceeds V_{bo1}(0.4V typ). ACDET=L after T_{BO1}(typ.32ms) or T_{bo2}(typ.128ms) from P_BO pin drops from V_{BO2}(0.2V typ).

Moreover, if T_{BO3} (typ.250ms) passes from P_BO<V_{BO2}, DC/DC part and PFC part is stopped.

About every resistance of figure12, because P_BO pin is used PFC operation, please set R_{bo1}=4Mohm,R_{bo2}=16kohm for operating the range of P_BO pin voltage 0~1.8V. In this case, by the following formula, P_BO=0V~0.56V at the case AC100V, P_BO=0V~1.237V at the case AC220V.

$$P_BO = (\sqrt{2} \times V_{AC} - V_{F1}) \times \frac{R_{BO2}}{R_{BO1} + R_{BO2}}$$

Then

$$\sqrt{2} \times V_{AC} \gg V_{F1}$$

$$P_BO = \sqrt{2} \times V_{AC} \times \frac{R_{BO2}}{R_{BO1} + R_{BO2}}$$

Figure12. Block Diagram of Blown out Function

Figure13. Detection Way of Blown out Function

- A : P_BO > V_{bo1}(typ.0.4V) , ACDET=L->H
- B: After 150us from A DC/DC part starts up.
- C:QR_FB<V_{FCLP1B} (typ.2.6V) . PFC part starts up.
- D: If PFC output is larger than constant voltage, ACTIMER=L->H.
- E: P_BO<V_{BO2} (typ.0.2V) Timer start operation by detection blown out protection.
- F:After T_{BO1}(typ.32ms) or T_{BO2}(typ.128ms) from E, ACDET=H->L. It is possible to set T_{BO1} and T_{BO2} at ACTIMER pin
- G:After T_{BO2}(typ.250ms) from E, DC/DC part and PFC part are OFF

(4)Controller part

(4-1)ACDET pin (8pin)

ACDET pin is NMOS open drain output. It monitors AC voltage, and is used for controlling secondary micon.

Show the using example figure14, 15. Please set VIN is H voltage of micon.

ACDET=L : Abnormal state($P_BO < 0.2V$)

ACDET=H : Normal state

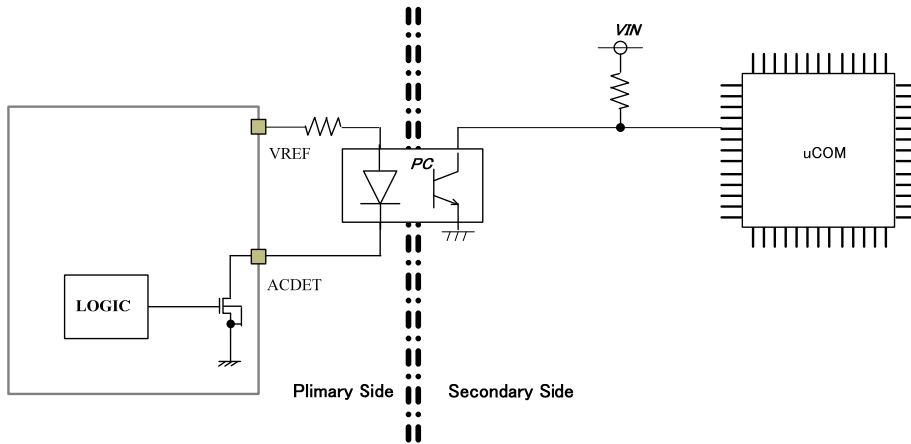

Figure14. Using Example of ACDET Pin

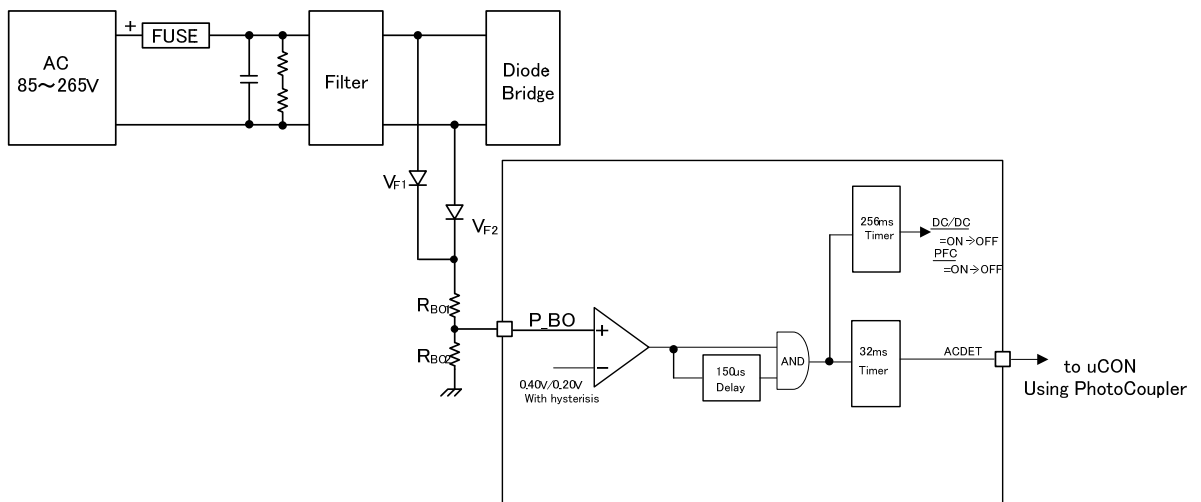

Figure15. Explanation of ACDET Pin

Next, show an easy sequence.

Figure16. At applied AC Input Voltage (P_{BO} voltage $< 0.4V$)

Because $P_{BO} < 0.4V$, DC/DC part is OFF.
 V_{CC} voltage $> 13.5V$

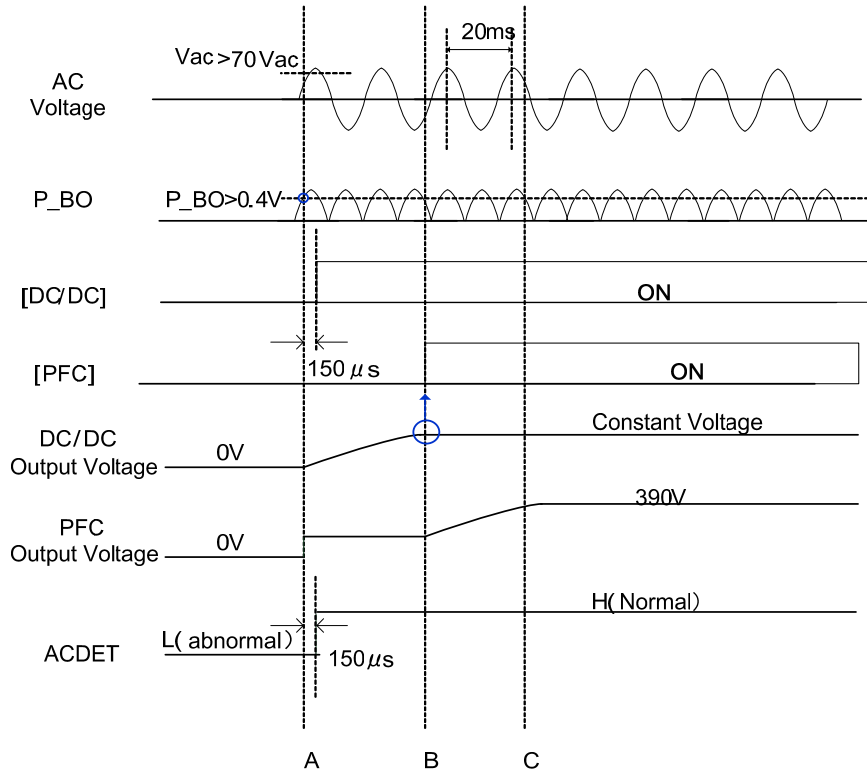

Figure17. At applied AC Input Voltage (P_{BO} voltage $> 0.4V$)

A: Detect $P_{BO} > 0.4V$, Quasi resonance starts operation After $150\mu s$
 B: PFC start up
 C: PFC output stabilized

*About PFC operation, by the micon, is able to be controlled using PFCON/OFF pin.

Figure18. At AC Power Supply OFF

A: Detect $P_{BO} < 0.2V$, internal ACDET timer operates. At this time, output of PWC downs.
 B: After 32ms (ACTIMER=L) from the point A, ACDET pin voltage is H->L, send to the μ -controller abnormal signals.
 C: After 250ms from the point of A, PFC and Quasi Resonant are stopped

Figure19. At AC Power Supply the case of operation moment stop

The case of AC voltage is OFF suddenly, constant area is masked.
 The time of constant area of masking is depends on ACTIMER pin.
 The case of ACTIMER pin=L, Mask time=32ms、 the case of ACTIMER pin=H, mask time=128ms.
 The moment of AC voltage momentary power interruption, because PFC output voltage is down by corresponding to load, please watch out.

(4-3) PFC ON/OFF pin

PFC ON/OFF pin is NMOS gate input pin. Refer to following the functions.

An internal timer is integrated for noise protection on PFC ON/OFF pin.

After $T_{PFC ON/OFF}$ (typ.1ms) from PFC ON/OFF H→L, PFC ON/OFF L operation starts. At PFC ON/OFF L→H, internal timer is not integrated.

function1) PFC circuit operation is OFF control.

In order to reduce standby power, IC controls PFC part operation at PFC ON/OFF pin.

function2) QR_SEL pin is Hi-z→L

Refer to example of using at figure 20.

PFC ON/OFF=L : DC/DC part=ON, PFC part=ON, QR_SEL=Hi-Z

PFC ON/OFF=H : DC/DC part=ON, PFC part=OFF, QR_SEL=L

Figure20. Using example of PFC ON/OFF pin

(4-4) LATCH/AUTOR pin

LATCH/AUTOR pin is NMOS gate input pin. Refer to example of using at figure21.
 Operation setting of protection function is shown at table3.

LATCH/AUTOR=L : Auto recovery
 LATCH/AUTOR=H : Latch

(Note) When the latch mode is used, it is necessary to apply 3.5V~4.5V to VREF terminal from the outside.

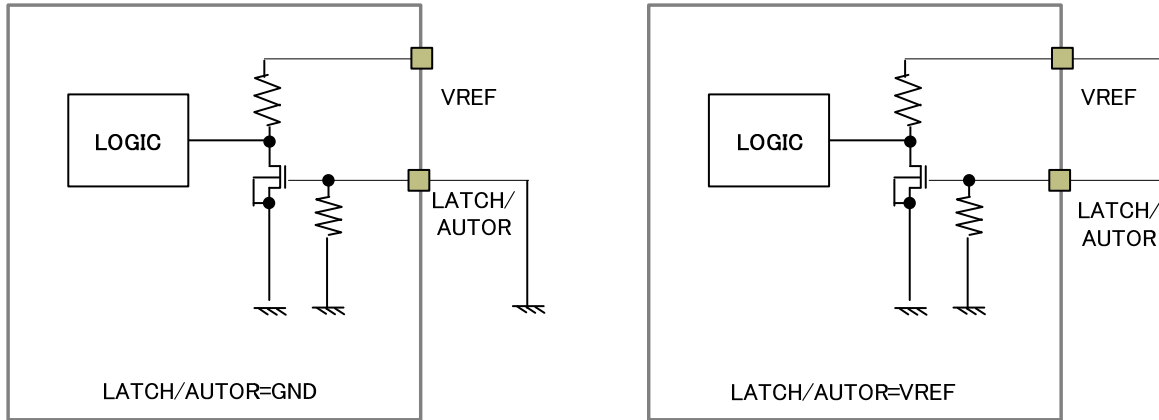

Figure21. Using example of LATCH/AUTOR pin

ITEM	Contents	LATCH/AUTOR=GND				LATCH/AUTOR			
		detection method	operation at detection	release method	operation at detection	detection method	operation at detection	release method	operation at detection
VREFUVLO	VREF PIN Low voltage protection function	VREF<2.5V (VREF falling)	PFC part, DC/DC part operation stops	VREF>3.5V (VREF rising)	PFC part DC/DC part enable to operate	same as LATCH/AUTOR=GND			
VCCUVLO	VCC PIN Low voltage protection function	VCC<7.0V (VCC falling)	PFC part, DC/DC part operation stops	VCC>13.5V (VCC rising)	PFC part DC/DC part enable to operate	same as LATCH/AUTOR=GND			
VCCOVP	VCC PIN Over voltage protection function	VCC>27V state continues between 150us (VCC rising)	PFC part, DC/DC part operation stops	VCC<23.0V (VCC falling)	PFC part DC/DC part enable to operate	VCC>27V (VCC rising)	PFC part, DC/DC part latch operation stops	VCC<6.5V (VCC falling)	PFC part, DC/DC part enable to operate
blown out	Input AC voltage Low voltage protection function	P_BO<0.2V state continues between 250ms	PFC part, DC/DC part operation stops	P_BO>0.4V (P_BO rising)	PFC part DC/DC part enable to operate	same as LATCH/AUTOR=GND			
QR_FB_OLP1	QR_FB pin Over current protection function	QR_FB>2.8V state continues between 250ms (QR_FB rising)	DC/DC part operation stops	QR_FB<2.6V (QR_FB falling)	normal operation	same as LATCH/AUTOR=GND			
QR_FB_OLP2	QR_FB pin Over current protection function	QR_FB>3.6V (QR_FB rising)	DC/DC part operation stops	QR_FB<3.4V (QR_FB falling)	normal operation	same as LATCH/AUTOR=GND			
QR_ZT OVP	QR_ZT pin Over voltage protection function	QR_ZT>3.5V state continues between 150us (QR_ZT rising)	DC/DC part operation stops	QR_ZT<3.5V (QR_ZT falling)	normal operation	QR_ZT>3.5V state continues between 150us (QR_ZT rising)	PFC part, DC/DC part latch operation stops	VCC<6.5V (VCC falling)	normal operation
P_VS short protection	P_VS pin Short protection function	P_VS<0.30V (P_VS falling)	PFC part operation stops	P_VS>0.30V (P_VS rising)	normal operation	same as LATCH/AUTOR=GND			
P_VS GAIN increasing	P_VS pin Low voltage gain increasing function	P_VS<2.25V (P_VS falling)	GM AMP GAIN increasing	P_VS>2.25V (P_VS rising)	normal operation	same as LATCH/AUTOR=GND			
P_VS OVP1	P_VS pin Over voltage protection function1	P_VS>2.625V (P_VS rising)	GM AMP GAIN falling	P_VS<2.625V (P_VS falling)	normal operation	same as LATCH/AUTOR=GND			
P_VS OVP2	P_VS pin Over voltage protection function2	P_VS>2.725V (P_VS rising)	PFC part stops	P_VS<2.600V (P_VS falling)	normal operation	P_VS>2.725V (P_VS rising)	PFC part, DC/DC part latch operation stops	VCC<6.5V (VCC下降時)	normal operation
COMP function	COMP pin Protection function	COMP<0.5V state continues between 150us (COMP rising)	PFC part, DC/DC part operation stops	COMP>0.50V (COMP rising)	normal operation	COMP<0.5V state continues between 150us (COMP rising)	PFC part, DC/DC part latch operation stops	VCC<6.5V (VCC falling)	normal operation

Table 3. List of Protection Function Operation Setting by LATCH/AUTOR pin

*Comparator level of protection function is shown by TYP value.

(4-5) ACTIMER pin

ACTIMER pin is NMOS gate input pin. Show example of using figure 22, 23
 Set the detect timer of AC voltage drop. (please refer to ACDET pin page)

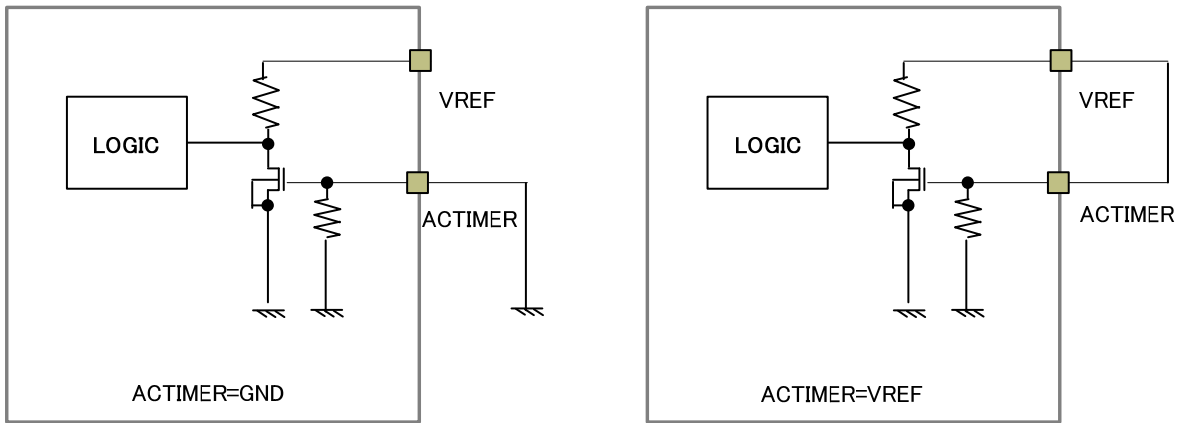

Figure22. Using example of ACTIMER pin

ACTIMER=GND : 32ms Timer
 ACTIMER=VREF : 128ms Timer

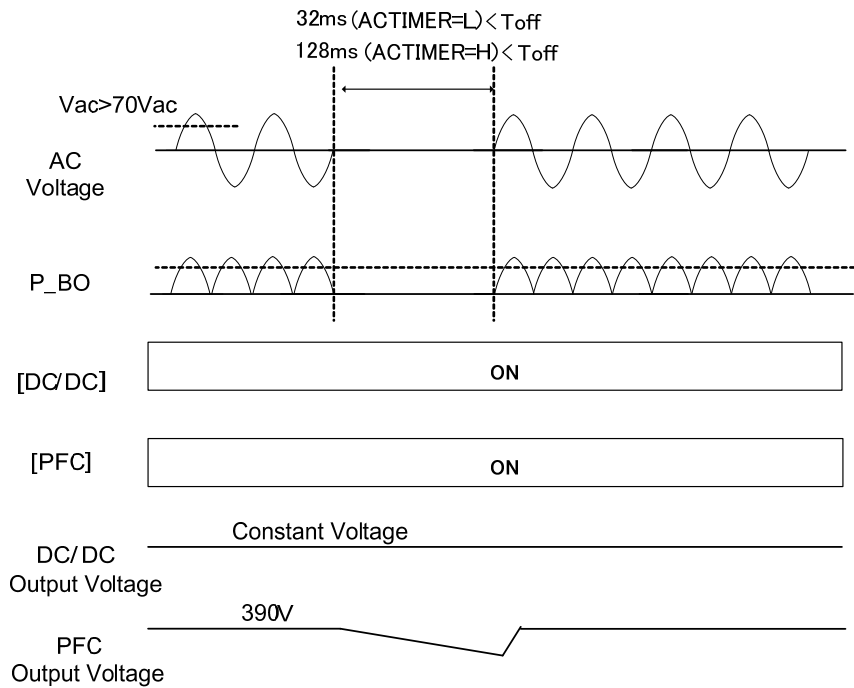

Figure23. AC power at the case momentary power interruption OFF

(4-6) COMP pin (external stop control function)

COMP pin is stop control pin. When COMP pin voltage drops from V_{COMP} (0.5V. typ), COMP pin stops PFC and DC/DC part operation.

This IC built in T_{COMP} (150us .typ) until stopping switching, prevent from stopping by noise.

COMP pin is in pull-up resistor R_{COMP} (25.9k Ω . typ), When COMP pin is the state of pull-down with lower resistance than R_T (3.70k Ω .typ), COMP pin detects abnormal. Show application examples at the figure24, 25, and 26.

Temperature protection by NTC thermister

By putting a thermister at the COMP pin, it is possible to stop latch on temperature rising. The case of this application, please design thermister resistor is R_T (3.70k Ω .typ) on temperature detection. (Figure24 and 25 is application circuit that latch on $T_a=110^{\circ}C$)

(Note) When the latch mode is used, it is necessary to apply 3.5V~4.5V to VREF terminal from the outside.

Figure 24. Temperature Protection Application

Figure 25. Temperature–Thermistor Resistor characteristic

Secondary over- voltage protection

This IC can detect secondary over-voltage by putting photo coupler to COMP pin.

(Note) When the latch mode is used, it is necessary to apply 3.5V~4.5V to VREF terminal from the outside.

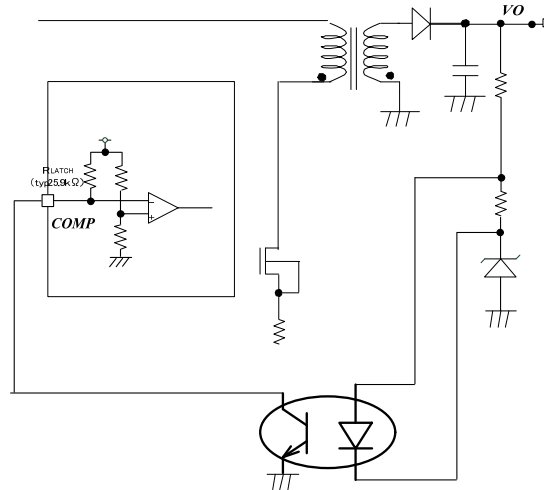

Figure26.Output Over Voltage Protection Application

Table 4. Changes of COMP function Operation by LATCH/AUTOR pin

ITEM	contents	LATCH/AUTOR=GND				LATCH/AUTOR=VREF			
		detection method	operation at detection	release method	operation at detection	detection method	operation at detection	release method	operation at detection
COMP function	COMP pin protection function	COMP<0.5V state continues between 150us (COMP falling)	PFC part, DC/DC part operation stops	COMP>0.50V (COMP rising)	normal operation	COMP<0.5V state continues between 150us (COMP falling)	PFC part, DC/DC part latch operation stops	P_VCC<6.5V (P_VCC falling)	normal operation
