## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# 12-bit, serial IN, parallel OUT driver BU2090 / BU2090F / BU2090FS / BU2092 / BU2092F / BU2092FV 

The BU2090, BU2090F, BU2090FS, BU2092, BU2092F, and BU2092FV are 12-bit serial input, parallel output drivers.
For the BU2090 / F / FS, data input is shifted to the 12-bit internal shift register on the rising edge of a clock pulse. On the falling edge of the pulse, if the DATA pin is HIGH, the data in the shift register is output in parallel to Q0 to Q11.
For the BU2092 / F / FV, shift data read at the rising edge of CLOCK is output in parallel to Q0 to Q11 at the rising edge of LCK. These ICs also have an OE pin, which when HIGH, forces data to be output, regardless of the shift data state.

## - Applications

Radio cassette players, telephones, compact audio systems, car stereos, and others

## -Features

1) Low power dissipation.
2) Operating voltages ranging from 2.7 to 5.5 V .
3) Output is Nch open drain.
4) High output withstand voltage of +25 V .
5) Diverse variety of packages.

BU2090 / F / FS: DIP16, SOP16, SSOP-A16
BU2092 / F / FV: DIP18, SOP18, SSOP-A18
(plastic molds)
6) High drive capability; direct lighting of green LED possible.

- Absolute maximum ratings ( $\mathrm{Ta}=25^{\circ} \mathrm{C}$ )
(BU2090 / F / FS, BU2092 / F / FV)

BU2092 / F / FV switching characteristics measurement conditions

Fig. 2

- Truth table

BU2092 / F / FV

| INPUT |  |  |  | FUNCTION |
| :---: | :---: | :---: | :---: | :---: |
| CLOCK | DATA | LCK | OE |  |
| $\times$ | $\times$ | $\times$ | H | Output (Q0 to Q11) disabled |
| $\times$ | $\times$ | $\times$ | L | Output (Q0 to Q11) enabled |
| $\pm$ | L | $\times$ | $\times$ | First cell of the shift register stores the LOW. Other cells, respectively, store data from the preceding cells or other prior data. (Output state is HOLD.) |
| $\uparrow$ | H | $\times$ | $\times$ | First cell of the shift register stores the HIGH. Other cells, respectively, store data from the preceding cells or other prior data. (Storage state and output state are HOLD.) |
| 7 | $\times$ | $\times$ | $\times$ | No change in shift register. |
| $\times$ | $\times$ | $\pm$ | $\times$ | Contents of shift register are stored in storage register. |
| $\times$ | $\times$ | 7 | $\times$ | No change in shift register. |

Q0 to Q11 output for the BU2090 / F / FS and BU2092 / F / FV is Nch open drain output. When the shift register transfer data is LOW, the corresponding output FET is ON (continuous state). When the transfer data is HIGH, the output FET is OFF (discontinuous).

## - Circuit operation

The logic of the DATA pin is sent to the 12-bit shift register on the rising edge of the CLOCK pulse. Subsequently, it is shifted from Q0 to Q11 for every clock rising edge.

For the BU2090 / F / FS
When the DATA pin is LOW on the CLOCK falling edge, the data does not change its output state. It is only shifted in the internal shift register. However, when the DATA pin is HIGH, the content of the 12-bit shift register is latched and is output to the corresponding Q0 to Q11.

Fig. 3 Operation timing chart

## For the BU2092 / F / FV

The content of the 12 -bit shift register is stored in the 12-bit storage register at the rising edge of LCK, and is output to the corresponding Q0 to Q11. When OE is HIGH, regardless of the content of the storage register, the output FET turns OFF and enters a HIGH (discontinuous) state.
