

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Hall ICs

# Unipolar Detection Hall ICs

BU52002GUL, BU52003GUL, BU52012NVX, BU52012HFV, BU52013HFV

No.10045ECT03

**●Description**

The unipolar Detection Hall IC detects only either the N pole or S pole.  
The output turns ON (active Low) upon detection.

**●Features**

- 1) Unipolar detection
- 2) Micropower operation (small current using intermittent operation method)
- 3) Ultra-compact CSP4 package (BU52002GUL, BU52003GUL)
- 4) Ultra- Small outline package (BU52012NVX)
- 5) Small outline package (BU52012HFV, BU52013HFV)
- 6) Line up of supply voltage  
For 1.8V Power supply voltage (BU52012NVX, BU52012HFV, BU52013HFV)  
For 3.0V Power supply voltage (BU52002GUL, BU52003GUL)
- 7) High ESD resistance 8kV(HBM)

**●Applications**

Mobile phones, notebook computers, digital video camera, digital still camera, etc.

**●Lineup matrix**

Function	Product name	Supply voltage (V)	Operate point (mT)	Hysteresis (mT)	Period (ms)	Supply current (AVG.) (μA)	Output type	Package
S pole	BU52002GUL	2.40~3.30	3.7 *	0.8	50	6.5	CMOS	VCSP50L1
	BU52012NVX	1.65~3.60	3.0 *	0.9	50	3.5	COMS	SSON004X1216
	BU52012HFV	1.65~3.30	3.0 *	0.9	50	3.5	CMOS	HVSOF5
N pole	BU52003GUL	2.40~3.30	-3.7 *	0.8	50	6.5	CMOS	VCSP50L1
	BU52013HFV	1.65~3.30	-3.0 *	0.9	50	3.5	CMOS	HVSOF5

※Plus is expressed on the S-pole; minus on the N-pole

### ● Absolute maximum ratings

BU52002GUL, BU52003GUL (Ta=25°C)

Parameter	Symbol	Ratings	Unit
Power Supply Voltage	V <sub>DD</sub>	-0.1~+4.5 <sup>※1</sup>	V
Output Current	I <sub>OUT</sub>	±1	mA
Power Dissipation	P <sub>d</sub>	420 <sup>※2</sup>	mW
Operating Temperature Range	T <sub>opr</sub>	-40~+85	°C
Storage Temperature Range	T <sub>stg</sub>	-40~+125	°C

※1. Not to exceed P<sub>d</sub>

※2. Reduced by 4.20mW for each increase in Ta of 1°C over 25°C (mounted on 50mm × 58mm Glass-epoxy PCB)

BU52012NVX (Ta=25°C)

Parameter	Symbol	Ratings	Unit
Power Supply Voltage	V <sub>DD</sub>	-0.1~+4.5 <sup>※3</sup>	V
Output Current	I <sub>OUT</sub>	±0.5	mA
Power Dissipation	P <sub>d</sub>	2049 <sup>※4</sup>	mW
Operating Temperature Range	T <sub>opr</sub>	-40~+85	°C
Storage Temperature Range	T <sub>stg</sub>	-40~+125	°C

※3. Not to exceed P<sub>d</sub>

※4. Reduced by 5.36mW for each increase in Ta of 1°C over 25°C (mounted on 70mm × 70mm × 1.6mm Glass-epoxy PCB)

BU52012HFV, BU52013HFV (Ta=25°C)

Parameter	Symbol	Ratings	Unit
Power Supply Voltage	V <sub>DD</sub>	-0.1~+4.5 <sup>※5</sup>	V
Output Current	I <sub>OUT</sub>	±0.5	mA
Power Dissipation	P <sub>d</sub>	536 <sup>※6</sup>	mW
Operating Temperature Range	T <sub>opr</sub>	-40~+85	°C
Storage Temperature Range	T <sub>stg</sub>	-40~+125	°C

※5. Not to exceed P<sub>d</sub>

※6. Reduced by 5.36mW for each increase in Ta of 1°C over 25°C (mounted on 70mm × 70mm × 1.6mm Glass-epoxy PCB)

### ● Magnetic, Electrical characteristics

BU52002GUL (Unless otherwise specified, V<sub>DD</sub>=3.0V, Ta=25°C)

Parameter	Symbol	Limits			Unit	Conditions
		Min.	Typ.	Max.		
Power Supply Voltage	V <sub>DD</sub>	2.4	3.0	3.3	V	
Operate Point	B <sub>opS</sub>	-	3.7	5.5	mT	
Release Point	B <sub>rpS</sub>	0.8	2.9	-	mT	
Hysteresis	B <sub>hysS</sub>	-	0.8	-	mT	
Period	T <sub>P</sub>	-	50	100	ms	
Output High Voltage	V <sub>OH</sub>	V <sub>DD</sub> -0.4	-	-	V	B < B <sub>rpS</sub> I <sub>OUT</sub> = -1.0mA <sup>※7</sup>
Output Low Voltage	V <sub>OL</sub>	-	-	0.4	V	B <sub>opS</sub> < B I <sub>OUT</sub> = +1.0mA <sup>※7</sup>
Supply Current	I <sub>DD(AVG)</sub>	-	6.5	9	μA	Average
Supply Current During Startup Time	I <sub>DD(EN)</sub>	-	4.7	-	mA	During Startup Time Value
Supply Current During Standby Time	I <sub>DD(DIS)</sub>	-	3.8	-	μA	During Standby Time Value

※7. B = Magnetic flux density  
1mT=10Gauss

Positive (“+”) polarity flux is defined as the magnetic flux from south pole which is direct toward to the branded face of the sensor.

After applying power supply, it takes one cycle of period (T<sub>P</sub>) to become definite output.

Radiation hardness is not designed.

BU52003GUL (Unless otherwise specified,  $V_{DD}=3.0V$ ,  $T_a=25^{\circ}C$ )

Parameter	Symbol	Limits			Unit	Conditions
		Min.	Typ.	Max.		
Power Supply Voltage	$V_{DD}$	2.4	3.0	3.3	V	
Operate Point	$B_{opN}$	-5.5	-3.7	-	mT	
Release Point	$B_{rpN}$	-	-2.9	-0.8	mT	
Hysteresis	$B_{hysN}$	-	0.8	-	mT	
Period	$T_P$	-	50	100	ms	
Output High Voltage	$V_{OH}$	$V_{DD}-0.4$	-	-	V	$B_{rpN} < B$ $I_{OUT} = -1.0mA$ ※8
Output Low Voltage	$V_{OL}$	-	-	0.4	V	$B < B_{opN}$ $I_{OUT} = +1.0mA$ ※8
Supply Current	$I_{DD(AVG)}$	-	6.5	9	$\mu A$	Average
Supply Current During Startup Time	$I_{DD(EN)}$	-	4.7	-	mA	During Startup Time Value

**●Description of Operations**  
(Micropower Operation)

Fig.39

The unipolar detection Hall IC adopts an intermittent operation method to save energy. At startup, the Hall elements, amp, comparator and other detection circuit power ON and magnetic detection begins. During standby, the detection circuits power OFF, thereby reducing current consumption. The detection results are held while standby is active, and then output.

Reference period: 50ms (MAX100ms)  
Reference startup time: 24µs

(Offset Cancellation)

Fig.40

The Hall elements form an equivalent Wheatstone (resistor) bridge circuit. Offset voltage may be generated by a differential in this bridge resistance, or can arise from changes in resistance due to package or bonding stress. A dynamic offset cancellation circuit is employed to cancel this offset voltage.

When Hall elements are connected as shown in Fig. 40 and a magnetic field is applied perpendicular to the Hall elements, voltage is generated at the mid-point terminal of the bridge. This is known as Hall voltage.

Dynamic cancellation switches the wiring (shown in the figure) to redirect the current flow to a 90° angle from its original path, and thereby cancels the Hall voltage.

The magnetic signal (only) is maintained in the sample/hold circuit during the offset cancellation process and then released.

(Magnetic Field Detection Mechanism)

Fig.41

The Hall IC cannot detect magnetic fields that run horizontal to the package top layer.  
 Be certain to configure the Hall IC so that the magnetic field is perpendicular to the top layer.

BU52002GUL, BU52012HFV

Fig.42 S-Pole Detection

BU52002GUL, BU52012HFV detects and outputs for the S-pole only. Since it is unipolar, it does not recognize the N-pole.

BU52003GUL, BU52013HFV

Fig.43 N-Pole Detection

BU52003GUL, BU52013HFV detects and outputs for the N-pole only. Since it is unipolar, it does not recognize the S-pole.

The unipolar detection Hall IC detects magnetic fields running perpendicular to the top surface of the package. There is an inverse relationship between magnetic flux density and the distance separating the magnet and the Hall IC: when distance increases magnetic density falls. When it drops below the operate point (Bop), output goes HIGH. When the magnet gets closer to the IC and magnetic density rises, to the operate point, the output switches LOW. In LOW output mode, the distance from the magnet to the IC increases again until the magnetic density falls to a point just below Bop, and output returns HIGH. (This point, where magnetic flux density restores HIGH output, is known as the release point, Brp.) This detection and adjustment mechanism is designed to prevent noise, oscillation and other erratic system operation.

● Intermittent Operation at Power ON

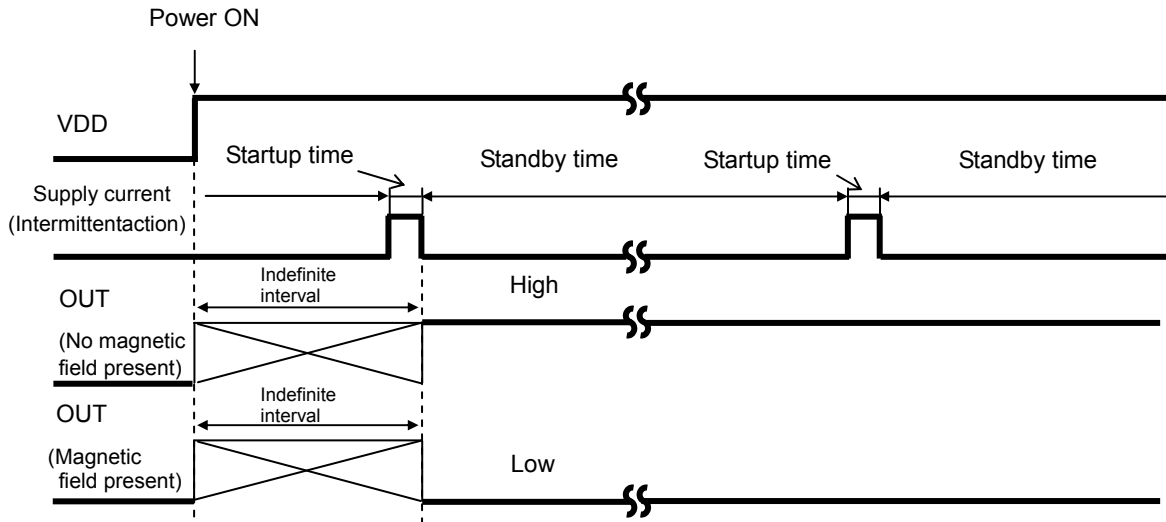

Fig.44

The unipolar detection Hall IC adopts an intermittent operation method in detecting the magnetic field during startup, as shown in Fig.44. It outputs to the appropriate terminal based on the detection result and maintains the output condition during the standby period. The time from power ON until the end of the initial startup period is an indefinite interval, but it cannot exceed the maximum period, 100ms. To accommodate the system design, the Hall IC output read should be programmed within 100ms of power ON, but after the time allowed for the period ambient temperature and supply voltage.

● Magnet Selection

Of the two representative varieties of permanent magnet, neodymium generally offers greater magnetic power per volume than ferrite, thereby enabling the highest degree of miniaturization, thus, neodymium is best suited for small equipment applications. Fig.45 shows the relation between the size (volume) of a neodymium magnet and magnetic flux density. The graph plots the correlation between the distance (L) from three versions of a 4mm X 4mm cross-section neodymium magnet (1mm, 2mm, and 3mm thick) and magnetic flux density. Fig.46 shows Hall IC detection distance – a good guide for determining the proper size and detection distance of the magnet. Based on the BU52012HFV, BU52013HFV operating point max 5.0 mT, the minimum detection distance for the 1mm, 2mm and 3mm magnets would be 7.6mm, 9.22mm, and 10.4mm, respectively. To increase the magnet's detection distance, either increase its thickness or sectional area.

(UNIT: mm)

**●Operation Notes**

- 1) Absolute maximum ratings  
Exceeding the absolute maximum ratings for supply voltage, operating conditions, etc. may result in damage to or destruction of the IC. Because the source (short mode or open mode) cannot be identified if the device is damaged in this way, it is important to take physical safety measures such as fusing when implementing any special mode that operates in excess of absolute rating limits.
- 2) GND voltage  
Make sure that the GND terminal potential is maintained at the minimum in any operating state, and is always kept lower than the potential of all other pins.
- 3) Thermal design  
Use a thermal design that allows for sufficient margin in light of the power dissipation (Pd) in actual operating conditions.
- 4) Pin shorts and mounting errors  
Use caution when positioning the IC for mounting on printed circuit boards. Mounting errors, such as improper positioning or orientation, may damage or destroy the device. The IC may also be damaged or destroyed if output pins are shorted together, or if shorts occur between the output pin and supply pin or GND.
- 5) Positioning components in proximity to the Hall IC and magnet  
Positioning magnetic components in close proximity to the Hall IC or magnet may alter the magnetic field, and therefore the magnetic detection operation. Thus, placing magnetic components near the Hall IC and magnet should be avoided in the design if possible. However, where there is no alternative to employing such a design, be sure to thoroughly test and evaluate performance with the magnetic component(s) in place to verify normal operation before implementing the design.
- 6) Operation in strong electromagnetic fields  
Exercise extreme caution about using the device in the presence of a strong electromagnetic field, as such use may cause the IC to malfunction.
- 7) Common impedance  
Make sure that the power supply and GND wiring limits common impedance to the extent possible by, for example, employing short, thick supply and ground lines. Also, take measures to minimize ripple such as using an inductor or capacitor.
- 8) GND wiring pattern  
When both a small-signal GND and high-current GND are provided, single-point grounding at the reference point of the set PCB is recommended, in order to separate the small-signal and high-current patterns, and to ensure that voltage changes due to the wiring resistance and high current do not cause any voltage fluctuation in the small-signal GND. In the same way, care must also be taken to avoid wiring pattern fluctuations in the GND wiring pattern of external components.
- 9) Exposure to strong light  
Exposure to halogen lamps, UV and other strong light sources may cause the IC to malfunction. If the IC is subject to such exposure, provide a shield or take other measures to protect it from the light. In testing, exposure to white LED and fluorescent light sources was shown to have no significant effect on the IC.
- 10) Power source design  
Since the IC performs intermittent operation, it has peak current when it's ON. Please taking that into account and under examine adequate evaluations when designing the power source.
