

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Low Duty LCD Segment Driver for Automotive Application

BU91796FS-M MAX 80 Segments (SEG20×COM4)

General Description

BU91796FS-M is a 1/4 duty general-purpose LCD driver that can be used for automotive applications and can drive up to 80 LCD Segments.

It can support operating temperature of up to +105°C and qualified for AEC-Q100 Grade2, as required for automotive applications.

Features

- AEC-Q100 Qualified (Note)
- Integrated RAM for Display Data (DDRAM):
20 x 4 bit (Max 80 Segment)
- LCD Drive Output:
4 Common Output, Max 20 Segment Output
- Integrated Buffer AMP for LCD Driving
- Integrated Oscillator Circuit
- No External Components
- Low Power Consumption Design

(Note) Grade 2

Applications

- Instrument Clusters
 - Climate Controls
 - Car Audios / Radios
 - Metering
 - White Goods
 - Healthcare Products
 - Battery Operated Applications
- etc.

Key Specifications

- Supply Voltage Range: +2.5V to +6.0V
- Operating Temperature Range: -40°C to +105°C
- Max Segments: 80Segments
- Display Duty: 1/4
- Bias: 1/3
- Interface: 2wire Serial Interface

Special Characteristics

- ESD(HBM): ±2000V
- Latch-up current: ±100mA

Package

W (Typ) x D (Typ) x H (Max)

Typical Application Circuit

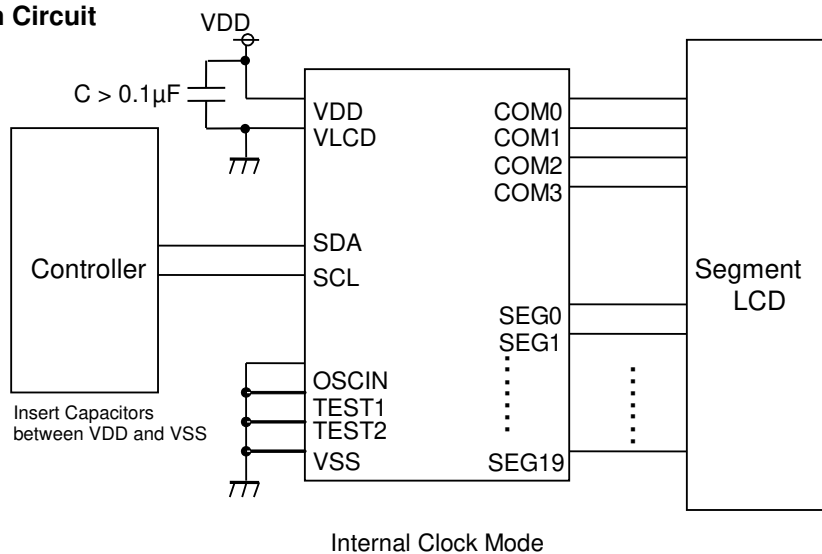

Figure 1. Typical Application Circuit

Block Diagram / Pin Configuration / Pin Description

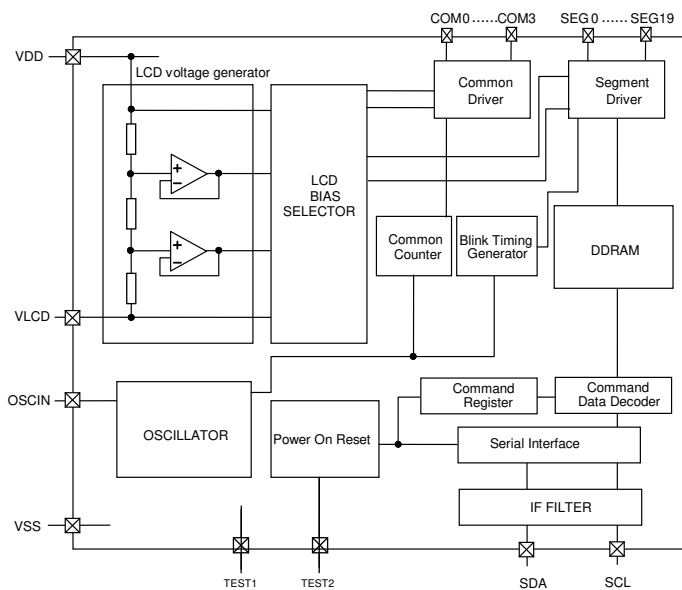

Figure 2. Block Diagram

Figure 3. Pin Configuration (TOP VIEW)

Table 2. Pin Description

Pin Name	Pin No.	I/O	Function	Handling when unused
TEST1	26	I	Test input (ROHM use only) Must be connected to VSS	VSS
TEST2	27	I	POR enable setting VDD: POR disable (Note) VSS: POR enable	VSS
OSCIN	28	I	External clock input External clock and Internal clock can be selected by command Must be connected to VSS when using internal oscillator	VSS
SDA	30	I/O	Serial data in-out terminal	-
SCL	29	I	Serial clock terminal	-
VSS	25	-	Ground	-
VDD	24	-	Power supply	-
VLCD	23	-	Power supply for LCD driving	-
SEG0 to SEG19	31,32, 1 to 18	O	SEGMENT output for LCD driving	OPEN
COM0 to COM3	19 to 22	O	COMMON output for LCD driving	OPEN

(Note) This function is guaranteed by design, not tested in production process. Software Reset is necessary to initialize IC in case of TEST2=VDD.

Absolute Maximum Ratings (VSS=0V)

Parameter	Symbol	Ratings	Unit	Remarks
Maximum Voltage1	VDD	-0.5 to +7.0	V	Power Supply
Maximum Voltage2	VLCD	-0.5 to VDD	V	LCD Drive Voltage
Power Dissipation	Pd	0.64 ^(Note1)	W	
Input Voltage Range	V _{IN}	-0.5 to VDD+0.5	V	
Operational Temperature Range	Topr	-40 to +105	°C	
Storage Temperature Range	Tstg	-55 to +125	°C	

(Note1) Delete by 6.4mW/°C when operating above Ta=25°C (when mounted in ROHM's standard board).

Caution: Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

Recommended Operating Conditions (Ta=-40°C to +105°C, VSS=0V)

Parameter	Symbol	Ratings			Unit	Remarks
		Min	Typ	Max		
Power Supply Voltage1	VDD	2.5	-	6.0	V	Power Supply
Power Supply Voltage2	VLCD	0	-	VDD-2.4	V	LCD Drive Voltage, VDD-VLCD ≥ 2.4V

Electrical Characteristics

DC Characteristics (VDD=2.5V to 6.0V, VLCD=0V, VSS=0V, Ta=-40°C to +105°C, unless otherwise specified)

Parameter	Symbol	Limits			Unit	Conditions
		Min	Typ	Max		
"H" Level Input Voltage	V _{IH}	0.7VDD	-	VDD	V	SDA,SCL,OSCIN
"L" Level Input Voltage	V _{IL}	VSS	-	0.3VDD	V	SDA,SCL,OSCIN

Functional Descriptions

Command / Data Transfer Method

BU91796FS-M is controlled by 2wire signal (SDA, SCL).

Figure 8. 2 wire Command/Data Transfer Format

It is necessary to generate START and STOP condition when sending Command or Display Data through this 2 wire serial interface.

Figure 9. Interface Protocol

Slave Address = "01111100" : Write Mode

The following procedure shows how to transfer Command and Display Data.

- (1) Generate "START condition".
- (2) Issue Slave Address.
- (3) Transfer Command and Display Data.
- (4) Generate "STOP condition"

Acknowledge (ACK)

Data format is comprised of 8 bits, Acknowledge bit is returned after sending 8-bit data.

After the transfer of 8-bit data (Slave Address, Command, Display Data), release the SDA line at the falling edge of the 8th clock. The SDA line is then pulled "Low" until the falling edge of the 9th clock SCL.

(Output cannot be pulled "High" because of open drain NMOS).

If acknowledge function is not required, keep SDA line at "Low" level from 8th falling edge to 9th falling edge of SCL.

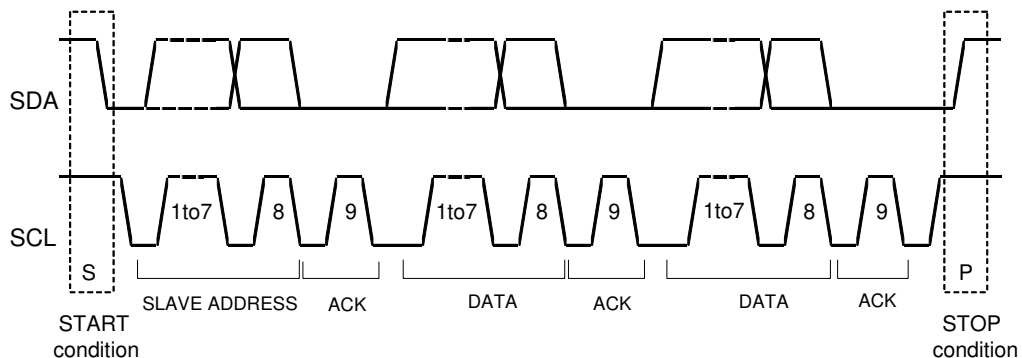

Figure 10. Acknowledge Timing

Functional Descriptions - continued

Command Transfer Method

Issue Slave Address (“01111100”) after generating “START condition”.
 The 1st byte after Slave Address always becomes command input.
 MSB (“command or data judge bit”) of command decide to next data is Command or Display Data.
 When set “command or data judge bit”=‘1’, next byte will be command.
 When set “command or data judge bit”=‘0’, next byte data is Display Data.

It cannot accept input command once it enters into Display Data transfer state.
 In order to input command again it is necessary to generate “START condition”.
 If “START condition” or “STOP condition” is sent in the middle of command transmission, command will be cancelled.
 If Slave Address is continuously sent following “START condition”, it remains in command input state.
 “Slave Address” must be sent right after the “START condition”.
 When Slave Address cannot be recognized in the first data transmission, no Acknowledge bit is generated and next transmission will be invalid. When data is invalid status, if “START condition” is transmitted again, it will return to valid status.

Consider the MPU interface characteristic such as Input rise time and Setup/Hold time when transferring command and data (Refer to MPU Interface).

Write Display and Transfer Method

BU91796FS-M has Display Data RAM (DDRAM) of 20x4=80bit.
 The relationship between data input and Display Data, DDRAM Data and address are as follows;

8-bit data is stored in DDRAM. ADSET command specifies the address to be written, and address is automatically incremented in every 4-bit data.
 Data can be continuously written in DDRAM by transmitting data continuously.
 When RAM data is written successively, after writing RAM data to 13h(SEG19), the address is returned to 00h(SEG0) by the auto-increment function

		DDRAM address													
		00h	01h	02h	03h	04h	05h	06h	07h	...	11h	12h	13h		
BIT	0	a	e	i	m									COM0	
	1	b	f	j	n									COM1	
	2	c	g	k	o									COM2	
	3	d	h	l	p									COM3	
		SEG0	SEG1	SEG2	SEG3	SEG4	SEG5	SEG6	SEG7		SEG17	SEG18	SEG19		

Display Data is written to DDRAM every 4-bit data.
 No need to wait for ACK bit to complete data transfer.

Functional Descriptions - continued

Oscillator

The clock signals for logic and analog circuit can be generated from internal oscillator or external clock. If internal oscillator circuit is used, OSCIN must be connected to VSS level. When using external clock mode, input external clock from OSCIN terminal after ICSET command setting.

Figure 11. Internal Clock Mode

Figure 12. External Clock Mode

LCD Driver Bias Circuit

BU91796FS-M generates LCD driving voltage with on-chip Buffer AMP. And it can drive LCD at low power consumption. Line or frame inversion can be set by DISCTL command. Refer to the "LCD driving waveform" for each LCD bias setting.

Blink Timing Generator

BU91796FS-M has Blink function. Blink mode is asserted by BLKCTL command. The Blink frequency varies depending on f_{CLK} characteristics at internal clock mode. Refer to Oscillation Characteristics for f_{CLK} .

Reset Initialize Condition

Initial condition after executing Software Reset is as follows.
 -Display is OFF.
 -DDRAM address is initialized (DDRAM Data is not initialized).
 Refer to Command Description for initial value of registers.

Command / Function List

Description List of Command / Function

No.	Command	Function
1	Set IC Operation (ICSET)	Software reset, internal/external clock setting
2	Display Control (DISCTL)	Frame frequency, Power save mode setting
3	Address Set (ADSET)	DDRAM address setting (00h to 13h)
4	Mode Set (MODESET)	Display on/off setting, 1/3bias setting
5	Blink Control (BLKCTL)	Blink off/0.5/1.0/2.0Hz blink setting
6	All Pixel Control (APCTL)	All pixels on/off during DISPON

Functional Descriptions - continued

Detailed Command Description

D7 (MSB) is a command or data judgment bit.
Refer to Command and data transfer method.

C: 0: Next byte is RAM write data.
1: Next byte is command.

Set IC Operation (ICSET)

MSB							LSB	
D7	D6	D5	D4	D3	D2	D1	D0	
C	1	1	0	1	*	P1	P0	

(* : Don't care)

Set software reset execution.

Setup	P1
No operation	0
Software Reset Execute	1

When "Software Reset" is executed, BU91796FS-M is reset to initial condition.
(Refer to Reset initialize condition)
Don't set Software Reset (P1) with P0 at the same time.

Set oscillator mode

Setup	P0	Reset initialize condition
Internal clock	0	○
External clock	1	-

Internal clock mode: OSCIN must be connected to VSS level.

External clock mode: Input external clock from OSCIN terminal.

<Frame frequency Calculation at external clock mode>

- DISCTL 80Hz setting: Frame frequency [Hz] = external clock [Hz] / 512
- DISCTL 71Hz setting: Frame frequency [Hz] = external clock [Hz] / 576
- DISCTL 64Hz setting: Frame frequency [Hz] = external clock [Hz] / 648
- DISCTL 53Hz setting: Frame frequency [Hz] = external clock [Hz] / 768

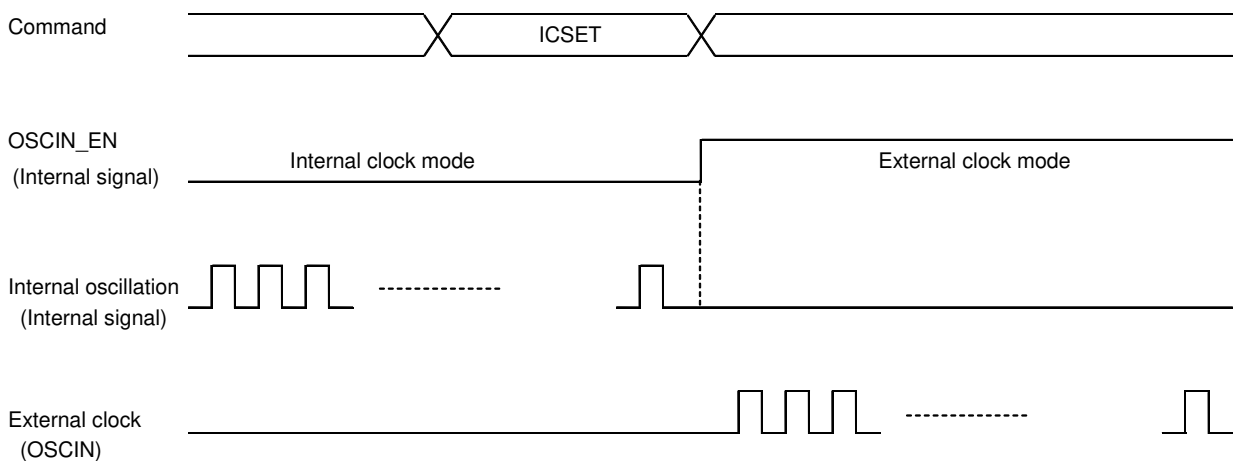

Figure 13. OSC MODE Switch Timing

Functional Descriptions - continued

Display Control (DISCTL)

MSB				LSB			
D7	D6	D5	D4	D3	D2	D1	D0
C	0	1	P4	P3	P2	P1	P0

Set Power save mode FR.

Setup	P4	P3	Reset initialize condition
Normal mode (80Hz)	0	0	○
Power save mode 1 (71Hz)	0	1	-
Power save mode 2 (64Hz)	1	0	-
Power save mode 3 (53Hz)	1	1	-

Power consumption is reduced in the following order:

Normal mode > Power save mode1 > Power save mode 2 > Power save mode 3.

Set LCD drive waveform.

Setup	P2	Reset initialize condition
Line inversion	0	○
Frame inversion	1	-

Power consumption is reduced in the following order:

Line inversion > Frame inversion

Typically, when driving large capacitance LCD, Line inversion will increase the influence of crosstalk.

Regarding driving waveform, refer to LCD driving waveform.

Set Power save mode SR.

Setup	P1	P0	Reset initialize condition
Power save mode 1	0	0	-
Power save mode 2	0	1	-
Normal mode	1	0	○
High power mode	1	1	-

Power consumption is increased in the following order:

Power save mode 1 < Power save mode 2 < Normal mode < High power mode

Use VDD- VLCD ≥ 3.0V in High power mode condition.

(Reference current consumption data)

Setup	Current consumption
Power save mode 1	×0.5
Power save mode 2	×0.67
Normal mode	×1.0
High power mode	×1.8

The data above is for reference only. Actual consumption depends on Panel load.

Address Set (ADSET)

MSB				LSB			
D7	D6	D5	D4	D3	D2	D1	D0
C	0	0	P4	P3	P2	P1	P0

The range of address can be set from 00000 to 10011 (bin).

Don't set out of range address, otherwise address will be set 00000.

Functional Descriptions - continued

Mode Set (MODESET)

MSB							LSB
D7	D6	D5	D4	D3	D2	D1	D0
C	1	0	*	P3	0	*	*

(* : Don't care)

Set display off and on.

Setup	P3	Reset initialize condition
Display off (DISPOFF)	0	○
Display on (DISPON)	1	-

Display off : Regardless of DDRAM Data, all SEGMENT and COMMON output will be stopped after 1frame of OFF data write. Display off mode will be disabled after Display on command.

Display on : SEGMENT and COMMON output will be active and start to read the Display Data from DDRAM.

Set 1/3 bias level

Setup	P2	Reset initialize condition
1/3 Bias	0	○
Prohibit	1	-

Refer to LCD driving waveform.

Blink Control (BLKCTL)

MSB							LSB
D7	D6	D5	D4	D3	D2	D1	D0
C	1	1	1	0	*	P1	P0

(* : Don't care)

Set blink mode.

Blink mode (Hz)	P1	P0	Reset initialize condition
OFF	0	0	○
0.5	0	1	-
1.0	1	0	-
2.0	1	1	-

The Blink frequency varies depending on f_{CLK} characteristics at internal clock mode.

Refer to Oscillation Characteristics for f_{CLK} .

All Pixel Control (APCTL)

MSB							LSB
D7	D6	D5	D4	D3	D2	D1	D0
C	1	1	1	1	1	P1	P0

All display set ON, OFF

Setup	P1	Reset initialize condition
Normal	0	○
All pixel on (APON)	1	-

Setup	P0	Reset initialize condition
Normal	0	○
All pixel off (APOFF)	1	-

All pixels on: All pixels are ON regardless of DDRAM Data.

All pixels off: All pixels are OFF regardless of DDRAM Data.

This command is valid in Display on status. The data of DDRAM is not changed by this command.

If set both P1 and P0 = "1", APOFF will be selected.

LCD Driving Waveform

(1/3bias)

Line Inversion

Frame Inversion

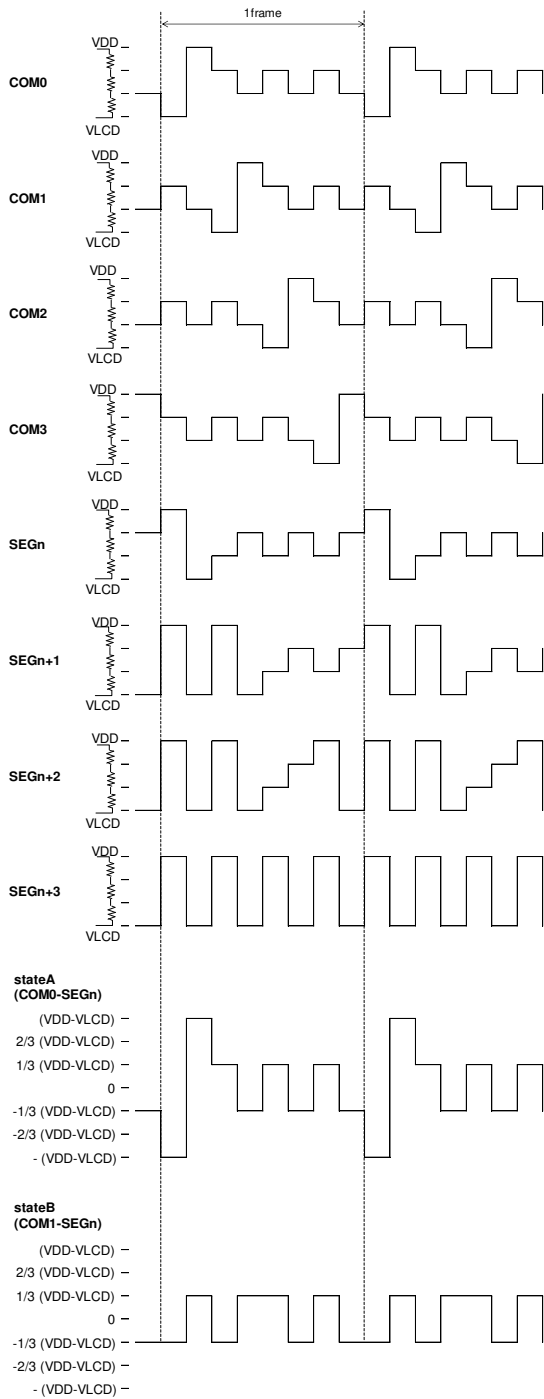

Figure 14. LCD Waveform at Line Inversion (1/3bias)

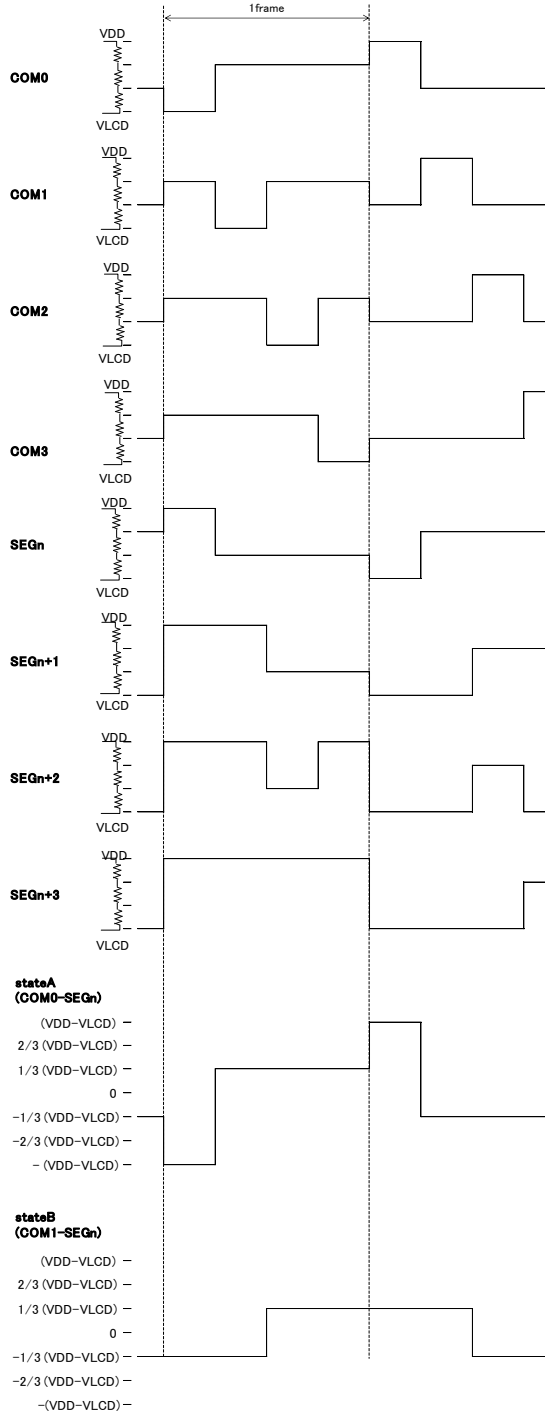

Figure 15. LCD Waveform at Frame Inversion (1/3bias)

Example of Display Data

If LCD layout pattern is like Figure 16 and Figure 17, and display pattern is like Figure 18, Display Data will be shown as below.

Figure 16. Example COM Line Pattern

Figure 17. Example SEG Line Pattern

Figure 18. Example Display Pattern

<DDRAM Data mapping in Figure 18 display pattern>

STOP									

Abnormal operation may occur in BU91796FS-M due to the effect of noise or other external factor. To avoid this phenomenon, it is highly recommended to input command according to sequence described above during initialization, display on/off and refresh of RAM data.

Cautions in Power ON/OFF

To prevent incorrect display, malfunction and abnormal current, follow Power On/Off sequence shown in waveform below.

VDD must be turned on before VLCD during power up sequence.

VDD must be turned off after VLCD during power down sequence.

Set $VDD - 2.4 \geq VLCD$, $t1 > 0ns$ and $t2 > 0ns$.

To refrain from data transmission is strongly recommended while power supply is rising up or falling down to prevent from the occurrence of disturbances on transmission and reception.

Figure 19. Power ON/OFF Waveform

Caution in P.O.R Circuit Use

BU91796FS-M has "P.O.R" (Power-On Reset) circuit and Software Reset function. Keep the following recommended Power-On conditions in order to power up properly.

Set power up conditions to meet the recommended t_R , t_F , t_{OFF} , and V_{BOT} specification below in order to ensure P.O.R operation.

Set pin TEST2="L" to enable POR circuit.

Recommended condition of t_R , t_F , t_{OFF} , V_{BOT} ($T_a=+25^{\circ}C$)

$t_R^{(Note)}$	$t_F^{(Note)}$	$t_{OFF}^{(Note)}$	$V_{BOT}^{(Note)}$
1ms to 500ms	1ms to 500ms	Min 20ms	Less than 0.1V

(Note) This function is guaranteed by design, not tested in production process.

Figure 20. Power ON/OFF Waveform

When it is difficult to keep above conditions, it is possibility to cause meaningless display due to no IC initialization. Please execute the IC initialization as quickly as possible after Power-On to reduce such an affect.

See the IC initialization flow as below.

Setting TEST2="H" disables the POR circuit, in such case, execute the following sequence.

Note however that it cannot accept command while supply is unstable or below the minimum supply range.

Note also that software reset is not a complete alternative to POR function.

1. Generate STOP Condition

3. Issue Slave Address

4. Execute Software Reset (ICSET) Command

Display off Operation in External Clock Mode

After receiving MODESET(Display off), BU91796FS-M enters to DISPOFF sequence synchronized with frame then Segment and Common ports output VSS level after 1frame of OFF data write.

Therefore, in external clock mode, it is necessary to input the external clock based on each frame frequency setting after sending MODESET(Display off).

For the required number of clock, refer to Power save mode FR of DISCTL.

Please input the external clock as below.

DISCTL 80HZ setting(Frame frequency [Hz] = external clock [Hz] / 512), it needs over 1024clk

DISCTL 71HZ setting(Frame frequency [Hz] = external clock [Hz] / 576) , it needs over 1152clk

DISCTL 64HZ setting(Frame frequency [Hz] = external clock [Hz] / 648) , it needs over 1296clk

DISCTL 53HZ setting(Frame frequency [Hz] = external clock [Hz] / 768) , it needs over 1536clk

Please refer to the timing chart below.

Figure 23. External Clock Stop Timing

Note on the Multiple Devices be Connected to 2 Wire Interface

Do not access the other device without power supply (VDD) to BU91796FS-M.

Figure 24. Example of BUS connection

To control the slope of the falling edge, a capacitor is connected between gate and drain of a NMOS transistor (Refer to Figure 25).

The gate is in a high-impedance state when the power supply (VDD) is not supplied.

In this condition, the gate voltage is pulled up by the current flow through the capacitance as a result of the SDA signal's transition from LOW to HIGH.

The NMOS transistor turns on and draws some current (I_{ds}) from the SDA port if the gate voltage (V_g) is higher than the threshold voltage (V_{th}).

An external resistor (R) is connected between the power line and SDA line to keep the SDA line as logic HIGH. But the line cannot be kept as logic HIGH if the voltage drop ($R \cdot I_{ds}$) is large.

Apply power supply(VDD) to BU91796FS-M when the multiple devices are on the same bus.

Operational Notes

1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. Thermal Consideration

Should by any chance the power dissipation rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. The absolute maximum rating of the Pd stated in this specification is when the IC is mounted on a 70mm x 70mm x 1.6mm glass epoxy board. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the Pd rating.

6. Recommended Operating Conditions

These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

8. Operation Under Strong Electromagnetic Field

Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

9. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

10. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

Operational Notes – continued**11. Unused Input Pins**

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

12. Regarding the Input Pin of the IC

In the construction of this IC, P-N junctions are inevitably formed creating parasitic diodes or transistors. The operation of these parasitic elements can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions which cause these parasitic elements to operate, such as applying a voltage to an input pin lower than the ground voltage should be avoided. Furthermore, do not apply a voltage to the input pins when no power supply voltage is applied to the IC. Even if the power supply voltage is applied, make sure that the input pins have voltages within the values specified in the electrical characteristics of this IC.
