# mail

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## **Standard LCD Segment Driver**

### BU9797FUV-M MAX 144 Segments (SEG36×COM4)

#### Features

- Integrated RAM for Display Data (DDRAM): 36 x 4 bit (Max 144 Segment)
- LCD Drive Output:
- 4 Common Output, Max 36 Segment Output
- Integrated Buffer AMP for LCD Driving
- Integrated Oscillator Circuit
- No External Components
- Low Power Consumption Design

#### Key Specifications

- Supply Voltage Range:
- Operating Temperature Range:
- Max Segments:
- Display Duty:
- Bias:
- Interface:

+2.5V to +5.5V -40°C to +85°C 144Segments 1/4 1/2, 1/3 selectable 2wire serial interface

#### Package

W (Typ) x D (Typ) x H (Max)

#### Applications

- Telephone
- FAX
- Portable equipment (POS, ECR, PDA etc.)
- DSC
- DVC
- Car audio
- Home electrical appliance
- Meter equipment

Etc.

#### **Typical Application Circuit**

**BU9797FUV** 

Using internal oscillator

Figure 1. Typical application circuit

OProduct structure : Silicon monolithic integrated circuit OThis product has no designed protection against radioactive rays.

#### Block Diagram / Pin Configuration / Pin Description

#### **BU9797FUV**

Figure 2. Block Diagram

Figure 3. Pin Configuration (TOP VIEW)

Pin Name	Pin No.	I/O	Table 1. Pin Description           Function
TEST1	13	I	Test input (ROHM use only) Must be connect to VSS
NC	17		OPEN terminal
OSCIN	14	I	External clock input External clock and Internal clock can be selected by command Must be connect to VSS when use internal oscillator
SDA	16	I/O	Serial data in-out terminal
SCL	15	I	Serial clock for data transfer terminal
VSS	12		Ground
VDD	11		Power supply
VLCD	10		Power supply for LCD driving
SEG0 to 35	18-48, 1-5	0	SEGMENT output for LCD driving
COM0 to 3	6-9	0	COMMON output for LCD driving

#### . . . . \_ .

#### Absolute Maximum Ratings (Ta=25°C, VSS=0V)

Parameter	Symbol	Ratings	Unit	Remarks
Power Supply Voltage1	VDD	-0.5 to +7.0	V	Power supply
Power Supply Voltage2	VLCD	-0.5 to VDD	V	LCD drive voltage
Power Dissipation	Pd	0.64	W	When use more than Ta=25°C, subtract 6.4mW per degree. (Package only)
Input Voltage Range	VIN	-0.5 to VDD+0.5	V	
Operational Temperature Range	Topr	-40 to +85	°C	
Storage Temperature Range	Tstg	-55 to +125	°C	

Caution: Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

#### **Recommended Operating Conditions** (Ta=-40°C to +85°C, VSS=0V)

Parameter	Symbol		Ratings		Unit	Remarks
Faidifieldi	Symbol	Min	Тур	Max	Unit	Remarks
Power Supply Voltage1	VDD	2.5	-	5.5	V	Power supply
Power Supply Voltage2	VLCD	0	-	VDD-2.4	V	LCD drive voltage, VDD-VLCD $\ge 2.4V$

#### **Electrical Characteristics**

DC Characteristics (VDD=2.5V to 5.5V, VLCD=0V, VSS=0V, Ta=-40°C to 85°C, unless otherwise specified)

Paramet	or	Symbol		Limits		Unit	Conditions
Falallie		Symbol	Min	Тур	Max	Unit	Conditions
"H" Level Input Vo	oltage	V <sub>IH</sub>	0.7VDD	-	VDD	V	SDA,SCL
"L" Level Input Vo	ltage	VIL	VSS	-	0.3VDD	V	SDA,SCL

#### Figure 4. Interface Timing

#### Figure 5. I/O equivalence circuit

#### Example of recommended circuit

External clock input mode

Figure 6. Example of recommended circuit

#### **Functional descriptions**

#### Command /Data transfer method

This device is controlled by 2wire signal (SDA, SCL).

It has to generate the condition such as START condition and STOP condition in 2wire serial interface transfer method.

#### Figure 8. Interface protcol

Method of how to transfer command and data is shown as follows.

- (1) Generate "START condition".
- (2) Issue Slave address.
- (3) Transfer command and display data.

#### Acknowledge (ACK)

Data format is 8bits and return Acknowledge after transfer 8bits data.

When SCL 8th='L' after transfer 8bit data (Slave Address, Command, Display Data), output 'L' and open SDA line. When SCL 9th='L', stop output function.

(As Output format is NMOS-Open-Drain, can't output 'H' level.)

If no need Acknowledge function, please input 'L' level from SCL 8th='L' to SCL 9th='L'.

#### Figure 9. Acknowledge timing

#### Command transfer method

Issue Slave Address ("01111100" for Write Mode or "01111101" for Read Mode) after generate "START condition". 1byte after Slave Address always becomes command input.

The least significant bit (LSB" of the Slave Address determines if the operation to be done is Write or Read operation. MSB ("command or data judge bit") of command decide to next data is command or display data.

When set "command or data judge bit"='1', next byte will be command.

When set "command or data judge bit"='0', next byte data is display data.

s	Slave address	A	1	Command	А	1	Command	А	1	Command	А	0	Command	А	Display Data	 Р
													1			

Once it becomes display data transfer condition, it cannot input command.

When want to input command again, please generate "START condition" once.

If "START condition" or "STOP condition" are inputted in the middle of command transmission, command will be canceled.

If Slave address is continuously inputted following "START condition", it will be in command input condition.

Please input "Slave Address" in the first data transmission after "START condition".

When Slave Address cannot be recognized in the first data transmission, Acknowledge does not return and next transmission will be invalid. When data transmission is in invalid status, if "START conditions" are transmitted again, it will return to valid status.

Please consider the MPU interface characteristic such as Input rise time and Setup/Hold time when transferring command and data (Refer to MPU Interface).

#### Write display and transfer method

Set R/W bit to "0" to come into Write Mode.

This device has Display Data RAM (DDRAM) of 36×4=144bit.

The relationship between data input and display data, DDRAM data and address are as follows;

		Slave addre	ess		-	Command			Command																				 
s	5	0111110	0	A	1	1101000	А	0	0000000	Α	а	b	С	d	е	f	g	h	А	i	j	k	I	m	n	0	р	А	 Р
		R/W=	<b>∳</b> 0 (\	Writ	e N	lode)	•	1			1	Dis	pla	y D	ata	1	1			1		1	1	1	1	I	1	•	 

8 bit data will be stored in DDRAM. The address to be written is the address specified by ADSET command, and the address is automatically incremented in every 4bit data.

Data can be continuously written in DDRAM by transmitting Data continuously.

(When RAM data is written successively after writing RAM data to 23h (SEG35), the address is returned to 00h (SEG0) by the auto-increment function.

Data transference to DDRAM will be executed in every 4bit data. So it will be finished to transfer with no need to wait ACK.

#### Read Display Data and Transfer Method

If the LSB of the slave address is "1", it will be set read mode.

The display data and command register value can be read during read mode.

The read mode sequence is shown below.

During read mode, the display data can be read from the DDRAM through the SDA line. The data will output with SCL input synchronous.

First it has to set address by write mode ADSET command to read display data.

If DDRAM address does not specify before DDRAM read, the read address will be start from the current DDRAM address.

Address will be increment +2 addresses by 8bit data output automatically.

Master side should be output ACK output by each 8bit data output.

It will be able to keep read mode and address increment by ACK from master side.

If there is no ACK response, SDA output status will be released, please transmit "STOP condition".

Read mode will be stopped by "STOP condition" transfer.

Address will be set 00h automatically after 23h. (It does not increment to 24h or 25h address)

An example of the display data read sequence is shown below.

#### Read command register and transfer method

Also the command registers can be read during read mode. The sequence for the command register read is shown below and is similar to the display data read sequence.

Regarding address setting, please refer to ADSET command. It will be able to read register values if it set address 24h or 25h. Address does not increment automatically after register value read.

Register	D7	D6	D5	D4	D3	D2	D1	D0	Address
REG1	0	0	P5	P4	P3	P2	P1	P0	24h
REG2	P7	P6	P5	P4	P3	P2	P1	P0	25h

REG1: P5 = Bias setting

P4 = Internal/External clock setting

P3 = Software Reset setting

P2 to P0 = Blink setting

REG2: P7 to P6 = Frame Frequency (FR) setting

P5 to P4 = Power Save Mode (SR) setting

P3 = Frame/Line inversion setting

P2 = Display ON/OFF setting

P1 = APON setting

P0 = APOFF setting

Address map between ADSET and ICSET is shown as follows;

				Write Mode								
			1	ADSET				ICS	SET			
RAM address	D7	D6	D5	D[4:0]	D7	D6	D5	D4	D3	D2 <sup>*</sup>	D1	D0
00 0000 to 01 1111 (bin)	0	0	0	0 0000 to 1 1111	1	1	1	0	1	0	0	0
10 0000 to 10 0011 (bin)	0	0	0	0 0000 to 0 0011	1	1	1	0	1	1	0	0

				Read mode								
			1	ADSET				ICS	SET			
RAM address	D7	D6	D5	D[4:0]	D7	D6	D5	D4	D3	<b>D2</b> <sup>*</sup>	D1	D0
00 0000 to 01 1111 (bin)	1	0	0	0 0000 to 1 1111	1	1	1	0	1	0	0	0
10 0000 to 10 0101 (bin)	1	0	0	0 0000 to 0 0101	1	1	1	0	1	1	0	0

(Note) Please take care ICSET [P2] setting.

#### OSCILLATOR

The clock signals for logic and analog circuit can be generated from internal oscillator or external clock. If internal oscillator circuit is used, OSCIN must be connected to VSS level. When using external clock mode, input external clock from OSCIN terminal after ICSET command setting.

Figure 11. Ext clock input mode

#### LCD Driver Bias Circuit

This device generates LCD driving voltage with on-chip Buffer AMP.
And it can drive LCD at low power consumption.
1/3 and 1/2Bias can set in MODESET command.
Line and frame inversion can set in DISCTL command.
Refer to the "LCD driving waveform" about each LCD driving waveform.

#### Blink timing generator

This device has Blink function.

This device will be Blink mode with BLKCTL command.

Blink frequency varies widely by characteristic of fCLK, when internal oscillation circuit. About the characteristics of  $f_{CLK}$ , refer to Oscillation Characteristics.

#### Reset initialize condition

Initial condition after execute Software Reset is as follows.

· Display is OFF.

DDRAM address is initialized (DDRAM Data is not initialized).

Refer to Command Description about initialize value of register.

#### Command / Function List

Description List of Command / Function

No.	Command	Function
1	Set IC Operation (ICSET)	Software reset, internal/external clock setting
2	Display control (DISCTL)	Frame frequency, power save mode setting
3	Address set (ADSET)	DRAM address setting (00h to 23h) Register address setting (24 to 25h)
4	Mode set (MODESET)	Display on/off,1/2bias,1/3bias
5	Blink control (BLKCTL)	Blink off/0.5s/1s/2s/3s/5s blink setting
6	All pixel control (APCTL)	All pixels on/off during DISON

#### **Detailed command description**

D7 (MSB) is bit for command or data judgment. Refer to Command and data transfer method.

- C: 0: Next byte is RAM write data.
  - 1: Next byte is command.

#### Set IC Operation (ICSET)

MSB							LSB	
D7	D6	D5	D4	D3	D2	D1	D0	
С	1	1	0	1	P2	P1	P0	

P2: MSB data of DDRAM address. Please refer to "ADSET" command.

Set Software Reset condition.

Setup	P1
No operation	0
Software reset	1

When "Software Reset" is executed, this device is reset to initial condition. (Refer to Reset initialize condition) Don't set Software Reset (P1) with P2, P0 at the same time.

Switch between internal clock and external clock.

Setup	P0	Initial condition
Internal clock	0	0
External clock input	1	

In Internal clock mode:

In external clock input mode::

OSCIN must be connect to VSS level. Input external clock from OSCIN terminal..

Command	X	ICSET		
OSCIN_EN (Internal signal)	Internal clock mode		External clock mode	
Internal oscillation (Internal signal)				
External clock (OSCIN)				$\square$

OSC MODE switch timing

#### **Display control (DISCTL)**

MSB							LSB	
D7	D6	D5	D4	D3	D2	D1	D0	
С	0	1	P4	P3	P2	P1	P0	1

Set Power save mode FR.

Setup	P4	P3	Reset initialize condition
Normal mode(80Hz)	0	0	0
Power save mode1(71Hz)	0	1	
Power save mode2(64Hz)	1	0	
Power save mode3(53Hz)	1	1	

(Note) Operation current decrease in order as

Normal mode > Power save mode1 > Power save mode2 > Power save mode 3.

#### Set LCD drive waveform.

Setup	P2	Reset initialize condition
Line inversion mode	0	0
Frame inversion mode	1	

(Note) Operation current is Line inversion > Frame inversion

Regarding driving waveform, refer to LCD driving waveform.

#### Set Power save mode SR.

Setup	P1	P0	Reset initialize condition
Power save mode 1	0	0	
Power save mode 2	0	1	
Normal mode	1	0	0
High power mode	1	1	

(Note1) Operation current increase in order as

Power save mode 1 < Power save mode 2 < Normal mode < High power mode. (Note2) Please use VDD- VLCD  $\ge$  3.0V in High power mode condition.

#### (Reference current consumption data)

Setup	Current consumption
Power save mode 1	×0.5
Power save mode 2	×0.67
Normal mode	×1.0
High power mode	×1.8

(Note) Above current consumption data is reference value. Change according to panel load.

Power save mode FR / LCD drive waveform / Power save mode SR will affect display image. Select the best setting in point of current consumption and display image view using LCD panel.

Mode	Flicker	Display grade/Contrast
Power save mode FR	0	-
LCD waveform	0	0
Power save mode SR	-	0

#### Address set (ADSET)

MSB							LSB	
D7	D6	D5	D4	D3	D2	D1	D0	
С	0	0	P4	P3	P2	P1	P0	
In the	write mo	ode. the	range c	of addres	ss can b	e set fro	om 0000	00 to 10

In the write mode, the range of address can be set from 000000 to 100011(bin). In the read mode, the range of address can be set from 000000 to 100101(bin).

(Note) Address [5:0]: MSB bit is specified in ICSET P2 and [4:0] are specified as ADSET P4 - P0. Don't specify another address, otherwise address will be set to "000000".

#### Mode Set (MODE SET)

MSB							LSB
D7	D6	D5	D4	D3	D2	D1	D0
С	1	0	*	P3	P2	*	*

(\* : Don't care)

Set display ON and OFF.

Setup	P3	Reset initialize condition
Display OFF (DISPOFF)	0	0
Display ON (DISPON)	1	

Display OFF: Despite of the contents of DDRAM, All of SEGMENT and COMMON output will stop after 1 frame period. Display OFF mode will finish in Display ON (DISPON).

Display ON: SEGMENT and COMMON output is active, start read operation to Display from DDRAM.

#### Set Bias level

Setup	P2	Reset initialize condition
1/3 Bias	0	0
1/2 Bias	1	

Regarding driving waveform, refer to LCD driving waveform.

#### Blink control (BLKCTL)

MSB	-	-					LSB
D7	D6	D5	D4	D3	D2	D1	D0
С	1	1	1	0	P2	P1	P0

Set Blink condition.

Setup	P2	P1	P0	Reset initialize condition
OFF	0	0	0	0
0.5Hz	0	0	1	
1Hz	0	1	0	
2Hz	0	1	1	
0.3Hz	1	0	0	
0.2Hz	1	0	1	

#### All pixel control (APCTL)

MSB							LSB	
D7	D6	D5	D4	D3	D2	D1	D0	
С	1	1	1	1	1	P1	P0	

All display Set ON, OFF

Setup	P1	Reset initialize condition
Normal	0	0
All pixel ON (APON)	1	

Setup	P0	Reset initialize condition
Normal	0	0
All pixel OFF (APOFF)	1	

All pixels ON : All pixels are ON regardless of DDRAM data.

All pixels OFF : All pixels are OFF regardless of DDRAM data.

(Note) All pixels ON/OFF is effective only at Display ON status. The contents of DDRAM do not change at this time. When set P1 and P0='1', APOFF is selected. APOFF has higher priority than APON.

#### LCD driving waveform

Figure 12. LCD waveform at line inversion (1/3bias)

Figure 13. LCD waveform at frame inversion (1/3bias)

Figure 14. LCD waveform in line inversion (1/2bias)

Frame inversion

Figure 15. LCD waveform in frame inversion (1/2bias)

#### Example of display data

If LCD layout pattern is like as Figure 16, Figure 17, and display pattern is like as Figure 18. Display data will be shown as follows;

Figure 16. E.g. COM line pattern

Figure 17. E.g. SEG line pattern

Figure 18. E.g. Display pattern

STOP									

\*: don't care

Abnormal operation may occur in BU9797FUV due to the effect of noise or other external factor. To avoid this phenomenon, please input command according to sequence described above during initialization, display ON/OFF and refresh of RAM data.

#### DISCTL setup flow chart

#### **Cautions in Power ON/OFF**

This device has "P.O.R" (Power-On Reset) circuit and Software Reset function. Please keep the following recommended Power-On conditions in order to power up properly.

Please set power up conditions to meet the recommended tR, tF, tOFF, and Vbot spec below in order to ensure P.O.R operation

Recommended condition of tR,	tF. tOFF. Vbot	(Ta=25°C)

ſ	tR	tF	tOFF	Vbot
	Max 5ms	Max 5ms	Min 20ms	Less than 0.3V

Figure 19. Power ON/OFF waveform

If it is difficult to meet above conditions, execute the following sequence after Power-On.

1. Generate STOP condition

Figure 20. Stop Condition

2. Generate START condition.

Figure 21. Start Condition

3. Issue slave address

4. Execute Software Reset (ICSET) command

#### **Operational Notes**

#### 1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

#### 2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

#### 3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

#### 4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

#### 5. Thermal Consideration

Should by any chance the power dissipation rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. The absolute maximum rating of the Pd stated in this specification is when the IC is mounted on a 70mm x 70mm x 1.6mm glass epoxy board. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the Pd rating.

#### 6. Recommended Operating Conditions

These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

#### 7. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

#### 8. Operation Under Strong Electromagnetic Field

Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

#### 9. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

#### 10. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

#### **Operational Notes – continued**

#### 11. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

#### 12. Regarding the Input Pin of the IC

In the construction of this IC, P-N junctions are inevitably formed creating parasitic diodes or transistors. The operation of these parasitic elements can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions which cause these parasitic elements to operate, such as applying a voltage to an input pin lower than the ground voltage should be avoided. Furthermore, do not apply a voltage to the input pins when no power supply voltage is applied to the IC. Even if the power supply voltage is applied, make sure that the input pins have voltages within the values specified in the electrical characteristics of this IC.

#### 13. Ceramic Capacitor

When using a ceramic capacitor, determine the dielectric constant considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

#### 14. Area of Safe Operation (ASO)

Operate the IC such that the output voltage, output current, and power dissipation are all within the Area of Safe Operation (ASO).

#### 15. Thermal Shutdown Circuit(TSD)

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's power dissipation rating. If however the rating is exceeded for a continued period, the junction temperature (Tj) will rise which will activate the TSD circuit that will turn OFF all output pins. When the Tj falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

#### 16. Over Current Protection Circuit (OCP)

This IC incorporates an integrated overcurrent protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.
