

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

CAT4201AGEVB

CAT4201 LED Driver Evaluation Board User's Manual

ON Semiconductor®

<http://onsemi.com>

EVAl BOARD USER'S MANUAL

Introduction

This document describes the CAT4201AGEVB evaluation board for the CAT4201 high efficiency step-down LED driver. Boards equipped with a 9 V battery and separate LED module can be used for demonstrations (see Figure 1).

The CAT4201 is a high efficiency step-down LED driver from Catalyst Semiconductor. This device is designed to drive high brightness LEDs up to 350 mA from a power supply up to 28 V. The LED brightness is controlled by a single resistor from the RSET pin to GND. Analog dimming and idle mode control are available through the CTRL input. An external circuit is provided on the CAT4201AGEVB for PWM dimming.

Operation Procedure

The CAT4201AGEVB board has two modes of operation. The first is normal operation and the second is operation with PWM dimming. Normal operation is set by placing jumper J1 in the right side position with pins 2 and 3 tied together. In this mode, the CTRL pin is pulled up to the LED cathode (LED-). The LED(s) will be at full brightness as

long as the CTRL pin is greater than 3 V. LED current can be set from 70 mA to 350 mA by adjusting potentiometer R2.

To set the board for PWM dimming, jumper J1 should be placed in the left side position with pins 1 and 2 tied together. A PWM signal can be applied to the PWM pin to dim the LED brightness. The amplitude of the PWM signal should be greater than 1 V.

Device Demonstration

To set up the CAT4201AGEVB for demonstrations, the board should be configured for normal operation with a 9 V battery securely placed in the holder. A separate LED module should also be plugged into the 6-pin connector, as shown in Figure 1. To turn on the LED, press and hold the *POWER* button. The LED will turn off once the button is released.

TEST PROCEDURE FOR THE CAT4201AGEVB EVALUATION BOARD

Introduction

This document describes the test procedure for the CAT4201 evaluation board. The test procedure must be followed step-by-step in order to verify that the evaluation board is fully functional.

Test Set-up

The CAT4201 evaluation board must have the jumper J1 installed between pins 2 and 3 (right position).

The test set-up uses the LED module plugged into the CAT4201 evaluation board.

The LED current is measured by removing the LED module jumper J2 and connecting an ammeter (A) between those two pins, see figure below.

Legend:

- f (PS) = 12 V DC power supply, connected between GND and VBAT
- f (A) = Ammeter, connected to LED module across J2 connector (jumper removed)
- f (V) = Voltmeter, connected between R1/R2 midpoint and GND

Note: The LED of the LED module is very bright and should be covered for eye protection.

Figure 3. CAT4201AGEVB Test Set-up

Test Procedure

The test procedure is achieved by following the sequence below step-by-step.

1. Connect the voltmeter (V) between R1/R2 midpoint and GND.
2. Connect the power supply (PS) between VBAT (+) and GND (-).
3. Turn the power supply on.
4. Measure the voltage on voltmeter (V).
5. Turn the potentiometer R2 and adjust until voltage is 0.22 V.
6. Measure the LED current (A).
7. The LED current must be between:
 $270 \text{ mA} \leq I_{\text{LED}} \leq 330 \text{ mA}$.
8. Measure the supply current on the power supply.
9. The supply current must be between:
 $90 \text{ mA} \leq I_{\text{SUPPLY}} \leq 115 \text{ mA}$.
10. Turn off the power supply (PS).
11. Disconnect the CAT4201 evaluation board.
