

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## 4 kb SPI Serial EEPROM

### Description

The CAT64LC40 is a 4 kb Serial EEPROM which is configured as 256 registers by 16 bits. Each register can be written (or read) serially by using the DI (or DO) pin. The CAT64LC40 is manufactured using ON Semiconductor's advanced CMOS EEPROM floating gate technology. It is designed to endure 1,000,000 program/erase cycles and has a data retention of 100 years. The device is available in 8-pin DIP, SOIC and TSSOP packages.

### Features

- SPI Bus Compatible
- Low Power CMOS Technology
- 2.5 V to 6.0 V Operation
- Self-Timed Write Cycle with Auto-Clear
- Hardware Reset Pin
- Hardware and Software Write Protection
- Commercial, Industrial and Automotive Temperature Ranges
- Power-up Inadvertent Write Protection
- RDY/BSY Pin for End-of-Write Indication
- 1,000,000 Program/Erase Cycles
- 100 Year Data Retention
- This Device is Pb-Free, Halogen Free/BFR Free and RoHS Compliant\*

## PIN CONNECTIONS

**Table 1. ABSOLUTE MAXIMUM RATINGS**

Parameters	Ratings	Unit
Temperature Under Bias	-55 to +125	°C
Storage Temperature	-65 to +150	°C
Voltage on any Pin with Respect to Ground (Note 1)	-2.0 to +V <sub>CC</sub> +2.0	V
V <sub>CC</sub> with Respect to Ground	-2.0 to +7.0	V
Package Power Dissipation Capability (T <sub>A</sub> = 25°C)	1.0	W
Lead Soldering Temperature (10 secs)	300	°C
Output Short Circuit Current (Note 2)	100	mA

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- The minimum DC input voltage is -0.5 V. During transitions, inputs may undershoot to -2.0 V for periods of less than 20 ns. Maximum DC voltage on output pins is V<sub>CC</sub> + 0.5 V, which may overshoot to V<sub>CC</sub> + 2.0 V for periods of less than 20 ns.
- Output shorted for no more than one second. No more than one output shorted at a time.

## Device Operation

The CAT64LC40 is a 4 kb nonvolatile memory intended for use with all standard controllers. The CAT64LC40 is organized in a 256 x 16 format. All instructions are based on an 8-bit format. There are four 16-bit instructions: READ, WRITE, EWEN, and EWDS. The CAT64LC40 operates on a single power supply ranging from 2.5 V to 6.0 V and it has an on-chip voltage generator to provide the high voltage needed during a programming operation. Instructions, addresses and data to be written are clocked into the DI pin

on the rising edge of the SK clock. The DO pin is normally in a high impedance state except when outputting data in a READ operation or outputting RDY/BSY status when polled during a WRITE operation.

The format for all instructions sent to this device includes a 4-bit start sequence, 1010, a 4-bit op code and an 8-bit address field or dummy bits. For a WRITE operation, a 16-bit data field is also required following the 8-bit address field.

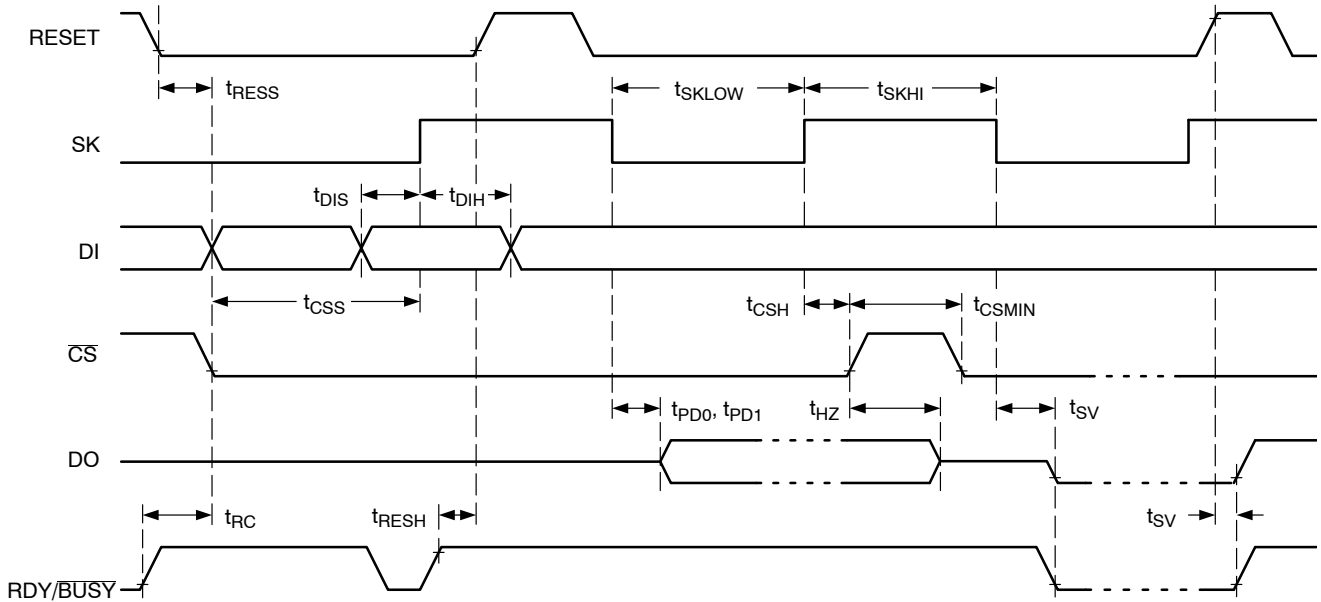

Figure 3. Synchronous Data Timing

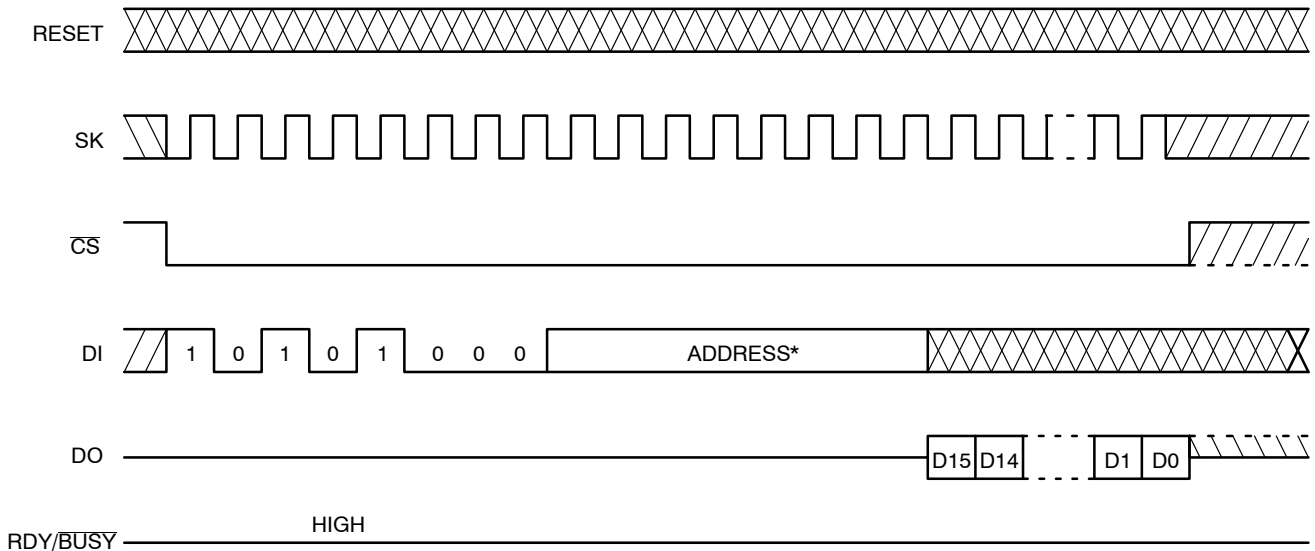

Figure 4. Read Instruction Timing

\*Please check the instruction set table for address

# CAT64LC40

The CAT64LC40 requires an active LOW  $\overline{CS}$  in order to be selected. Each instruction must be preceded by a HIGH-to-LOW transition of  $\overline{CS}$  before the input of the 4-bit start sequence. Prior to the 4-bit start sequence (1010), the device will ignore inputs of all other logical sequence.

## Read

Upon receiving a READ command and address (clocked into the DI pin), the DO pin will output data one  $t_{PD}$  after the falling edge of the 16th clock (the last bit of the address field). The READ operation is not affected by the RESET input.

## Write

After receiving a WRITE op code, address and data, the device goes into the AUTO-Clear cycle and then the WRITE cycle. The RDY/ $\overline{BSY}$  pin will output the  $\overline{BUSY}$  status (LOW) one  $t_{SV}$  after the rising edge of the 32<sup>nd</sup> clock (the last data bit) and will stay LOW until the write cycle is complete. Then it will output a logical "1" until the next WRITE cycle. The RDY/ $\overline{BSY}$  output is not affected by the input of  $\overline{CS}$ .

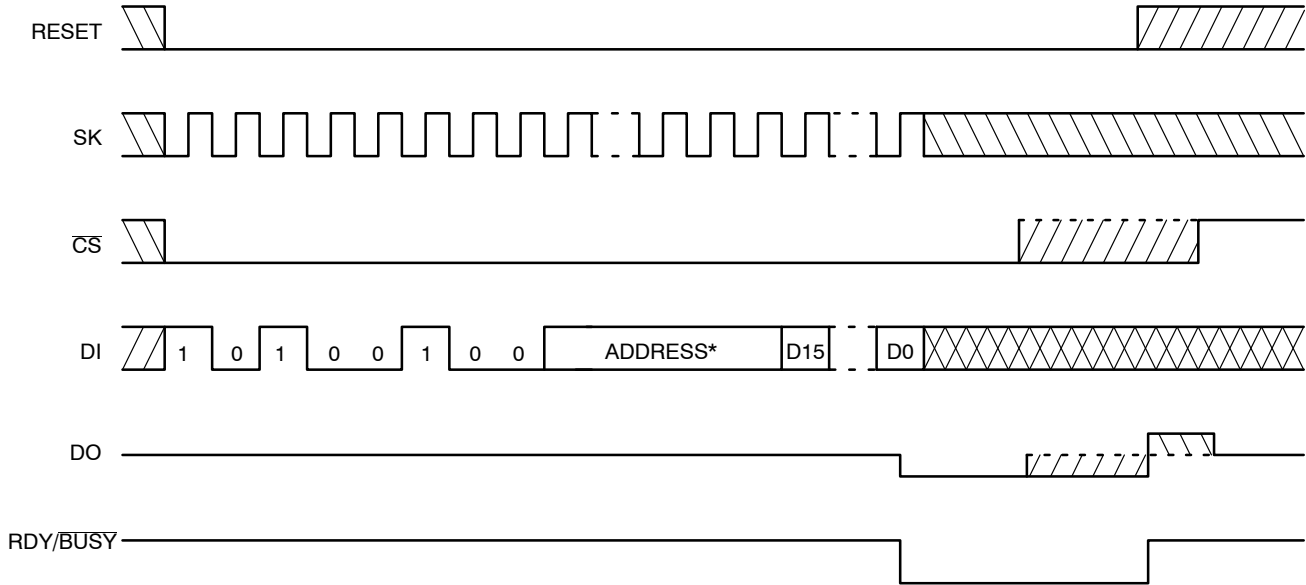

Figure 5. Write Instruction Timing

\*Please check instruction set table for address.

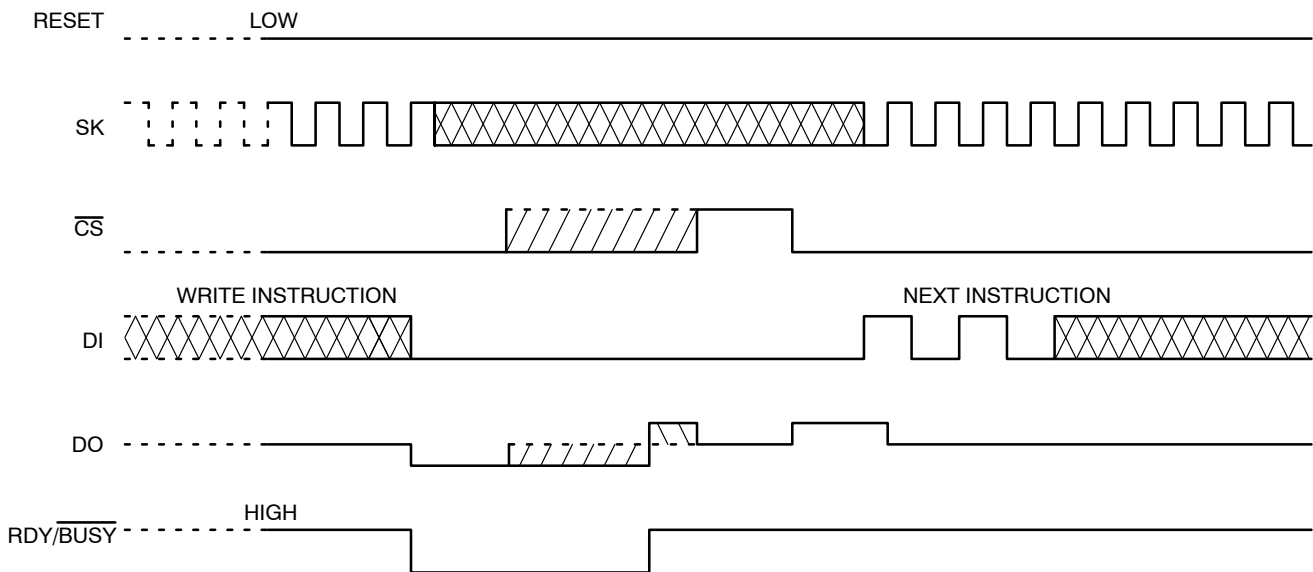

Figure 6. Ready/ $\overline{BUSY}$  Status Instruction Timing

# CAT64LC40

An alternative to get RDY/ $\overline{\text{BSY}}$  status is from the DO pin. During a write cycle, asserting a LOW input to the  $\overline{\text{CS}}$  pin will cause the DO pin to output the RDY/ $\overline{\text{BSY}}$  status. Bringing  $\overline{\text{CS}}$  HIGH will bring the DO pin back to a high impedance state again. After the device has completed a WRITE cycle, the DO pin will output a logical "1" when the device is deselected. The rising edge of the first "1" input on the DI pin will reset DO back to the high impedance state again.

The WRITE operation can be halted anywhere in the operation by the RESET input. If a RESET pulse occurs during a WRITE operation, the device will abort the operation and output a READY status.

NOTE: Data may be corrupted if a RESET occurs while the device is  $\overline{\text{BUSY}}$ . If the reset occurs before the  $\overline{\text{BUSY}}$  period, no writing will be initiated. However, if RESET occurs after the  $\overline{\text{BUSY}}$  period, new data will have been written over the old data.

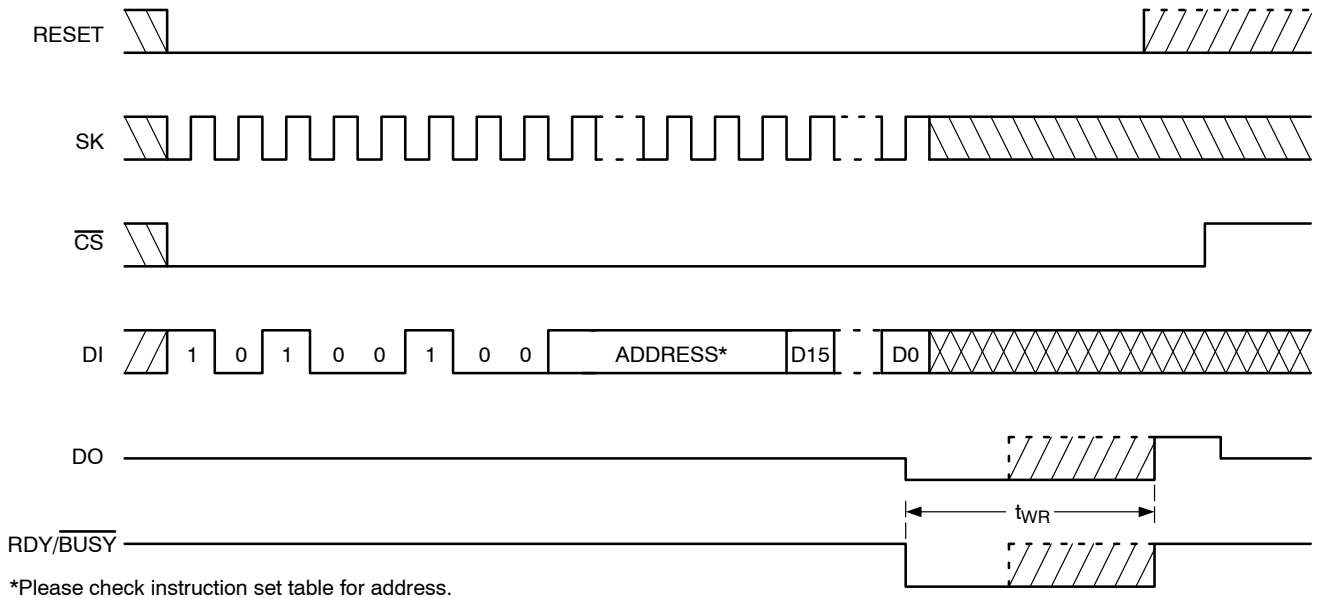

Figure 7. RESET During  $\overline{\text{BUSY}}$  Instruction Timing

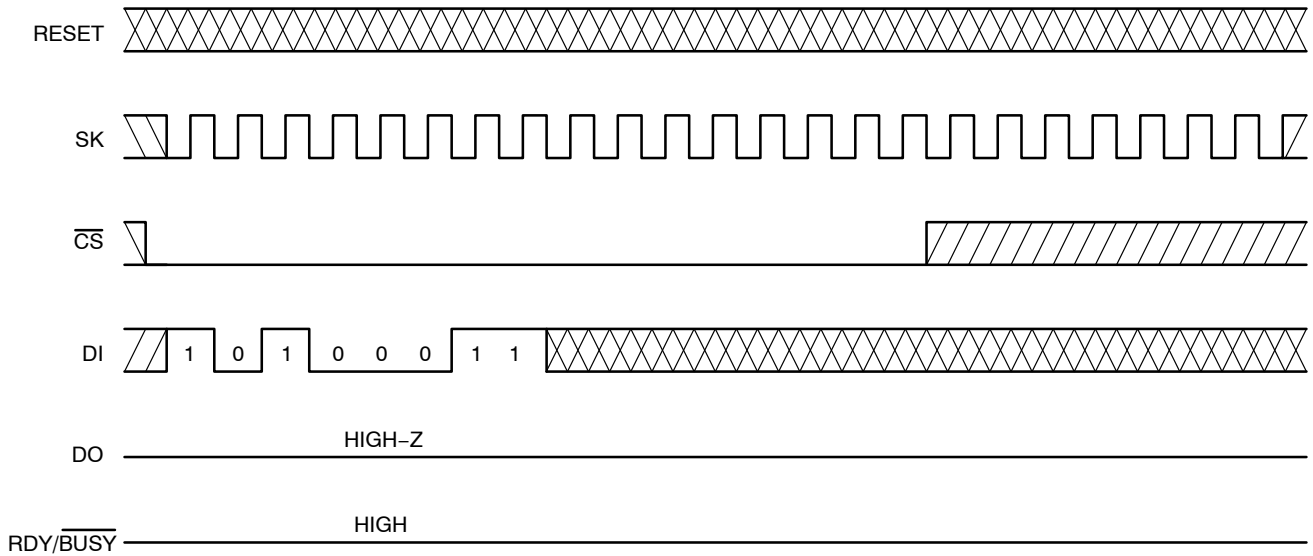

Figure 8. EWEN Instruction Timing

# CAT64LC40

## Reset

The RESET pin, when set to HIGH, will reset or abort a WRITE operation. When RESET is set to HIGH while the WRITE instruction is being entered, the device will not execute the WRITE instruction and will keep DO in High-Z condition.

When RESET is set to HIGH, while the device is in a clear/write cycle, the device will abort the operation and will display READY status on the RDY/ $\overline{\text{BSY}}$  pin and on the DO pin if  $\overline{\text{CS}}$  is low.

The RESET input affects only the WRITE and WRITEALL operations. It does not reset any other operations such as READ, EWEN and EWDS.

## Erase/Write Enable and Disable

The CAT64LC40 powers up in the erase/write disabled state. After power-up or while the device is in an erase/write disabled state, any write operation must be preceded by an execution of the EWEN instruction. Once enabled, the device will stay enabled until an EWDS has been executed or a power-down has occurred. The EWDS is used to prevent any inadvertent over-writing of the data. The EWEN and EWDS instructions have no effect on the READ operation and are not affected by the RESET input.
