

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Evaluation Board for the CS43L21

Features

- ◆ MUX'd Analog Output
 - Stereo RCA Output (w/Optional Load or LPF)
 - Stereo Headphone Jack
 - Mono Speaker Driver w/Banana Posts
- ◆ 8 kHz to 96 kHz S/PDIF Interface
 - CS8415 Digital Audio Receiver
- ◆ I/O Stake Headers
 - External Control Port Accessibility
 - External DSP Serial Audio I/O Accessibility
- ◆ Independent, Regulated Supplies
- ◆ 1.8 V to 3.3 V Logic Interface
- ◆ Hardware Control
 - 11 Pre-Defined Switch Settings
- ◆ FlexGUI S/W Control - Windows® Compatible
 - Pre-Defined & User-Configurable Scripts
- ◆ Layout and Grounding Recommendations

Description

The CDB43L21 evaluation board is an excellent means for evaluating the CS43L21 DAC. Evaluation requires a digital signal source, analog analyzer, and power supplies. Optionally, a Windows PC-compatible computer may be used to evaluate the CS43L21 in Software Mode.

System timing can be provided by the CS8415, by the CS43L21 with supplied master clock, or by an I/O stake header with a DSP connected.

RCA phono jacks are provided for the CS43L21 analog outputs. 1/8th inch jacks are also available for headphone output. Digital data input is available via RCA phono or optical connectors to the CS8415.

The Windows software provides a Graphical User Interface (GUI) to make configuration of the CDB43L21 easy. The software communicates through the PC's serial port/USB to configure the control port registers so that all the features of the CS43L21 can be evaluated. The evaluation board may also be configured to accept external timing and data signals for operation in a user application during system development.

ORDERING INFORMATION

CDB43L21

Evaluation Board

1. SYSTEM OVERVIEW

The CDB43L21 evaluation board is an excellent means for evaluating the CS43L21. Digital audio signal interfaces are provided, and an FPGA is used for easily configuring the board. [Section 2. “Software Mode Control” on page 7](#) and [Section 3. “Hardware Mode Control” on page 11](#) provide configuration details.

The CDB43L21 schematic set has been partitioned into six pages and is shown in [Figures 10 through 15](#). [“System Connections” on page 14](#) provides a description of all stake headers and connectors, including the default factory settings for all jumpers.

1.1 Power

Power is supplied to the evaluation board through the +5.0 V binding posts. Jumpers connect the CS43L21's power supplies to a regulated voltage of +1.8 V, 2.5 V or +3.3 V for VL and +1.8 V or 2.5 V for VD, VA and VA_HP. All voltage inputs must be referenced to the black binding post ground connector.

For current measurement purposes only, a series resistor is connected to each supply. The current is easily calculated by measuring the voltage drop across this resistor.

NOTE: The stake headers connected in parallel with these resistors must be shunted with the supplied jumper during normal operation.

WARNING: Please refer to the CS43L21 data sheet for allowable voltage levels.

1.2 Grounding and Power Supply Decoupling

The CS43L21 requires careful attention to power supply and grounding arrangements to optimize performance. The CDB43L21 demonstrates these optimal arrangements. [Figure 9 on page 15](#) provides an overview of the connections to the CS43L21. [Figure 16 on page 22](#) shows the component placement, [Figure 17 on page 23](#) shows the top layout, and [Figure 18 on page 24](#) shows the bottom layout. The decoupling capacitors are located as close to the CS43L21 as possible. Extensive use of ground plane fill in the evaluation board yields large reductions in radiated noise.

1.3 FPGA

The FPGA provides digital signal routing between the CS43L21, CS8415 and the I/O stake header. It also configures the Hardware Mode options of the CS8415 and provides routing control of the system master clock from an on-board oscillator, the CS8415 and the I/O stake header. The Cirrus FlexGUI software and “FPGA H/W Control” switches provide full control of the FPGA's routing and configuration options. [Section 2. “Software Mode Control” on page 7](#) and [Section 3. “Hardware Mode Control” on page 11](#) provide configuration details.

1.4 CS43L21

A complete description of the CS43L21 is included in the CS43L21 product data sheet, and a schematic is provided in [Figure 10 on page 16](#).

The CS43L21 may be configured using either the Cirrus FlexGUI or the on-board “CS43L21 H/W Control” switches. The Software Mode control port registers are accessible through the “Register Maps” tab of the Cirrus FlexGUI software. This tab provides low-level control of each bit. For easier configuration, additional tabs provide high-level control. The Hardware Mode, stand-alone controls for the CS43L21 are accessible through the on-board, stand-alone switches, “CS43L21 H/W Control.”

Clock and data source selections are made in the control port of the FPGA, accessible through the “General Configurations” tab of the Cirrus FlexGUI software or through the on-board “FPGA H/W Control” switches.

[Section 2. “Software Mode Control” on page 7](#) and [Section 3. “Hardware Mode Control” on page 11](#) provide configuration details.

1.5 CS8415 Digital Audio Receiver

A complete description of the CS8415 receiver ([Figure 12 on page 18](#)) and a discussion of the digital audio interface are included in the CS8415 data sheet.

The CS8415 converts the input S/PDIF data stream from either the optical or the RCA connector into PCM data for the CS43L21. The CS8415 operates in master or slave mode, generates a 256xFs master clock, and can operate in either the Left-Justified or I²S interface format.

Selections are made in the control port of the FPGA, accessible through the “General Configurations” tab of the Cirrus FlexGUI software or through the on-board “FPGA H/W Control” switches. [Section 2. “Software Mode Control” on page 7](#) and [Section 3. “Hardware Mode Control” on page 11](#) provide configuration details.

1.6 Oscillator

The on-board oscillator provides one of the system master clocks. Selections are made in the control port of the FPGA, accessible through the “General Configurations” tab of the Cirrus FlexGUI software or through the on-board switches, “FPGA H/W Control.” [Section 2. “Software Mode Control” on page 7](#) and [Section 3. “Hardware Mode Control” on page 11](#) provide configuration details.

The oscillator is mounted in pin sockets, allowing easy removal or replacement. Additional sockets are also installed, allowing the optional use of a half-can- or full-can-sized oscillator.

1.7 I/O Stake Headers

The evaluation board has been designed to allow interfacing with external systems via a serial port header (reference designation J5) and a control port header, “CS43L21 S/W Control.” The serial port header provides access to the serial audio signals required to interface with a DSP ([Figure 13 on page 19](#)). Selections are made in the control port of the FPGA, accessible through the “General Configurations” tab of the Cirrus FlexGUI software or through the on-board “FPGA H/W Control” switches. [Section 2. “Software Mode Control” on page 7](#) and [Section 3. “Hardware Mode Control” on page 11](#) provide configuration details.

The control port header provides bidirectional access to the SPI™/I²C® control port signals by simply removing all the shunt jumpers from the “PC” position. The user may then choose to connect a ribbon cable to the “CONTROL” position, allowing operation of the CS43L21 in a user-application for system development. A single “GND” row for the ribbon cable’s ground connection is provided to maintain signal integrity. Two unpopulated pull-up resistors are also available should the user choose to use the CDB for the I²C power rail.

1.8 Analog Outputs

RCA connectors are connected directly to the output of the CS43L21 to allow evaluation of the ground-centered analog outputs. The Right Channel and Left Channel stake headers optionally connect a passive-filtered output to the RCA connectors. For evaluation of the CS43L21’s drive strength into a load, the 16 W HP Load stake headers connect the analog outputs to 16 W. Headphones may also be connected to the 1/8th inch jack. When connecting headphones, the 16 Ω load resistors should be disconnected by removing the jumpers on each stake header.

One of the analog outputs may be connected to a speaker driver through the “Speaker” stake header. A mono speaker may then be driven via the red and black banana jack. The red banana jack designates the positive terminal and the black designates the negative.

1.9 Stand-Alone Switches

The “FPGA H/W Control” and “CS43L21 H/W Control” switches control all Hardware Mode options. [Section 3. “Hardware Mode Control” on page 11](#) provides a description of each topology.

1.10 Control Port Connectors

A graphical user interface is available for the CDB43L21, allowing easy manipulation of each register. This GUI interfaces with the CDB via the RS-232 connector and controls all Software Mode options. [Section 2. “Software Mode Control” on page 7](#) provides a description of the GUI.

1.10.1 USB Connector

Connecting a USB port cable from a PC to the USB connector and launching the Cirrus FlexGUI software enables one to use the CDB43L21.

1.10.2 RS-232 Connector

Connecting a cable to the RS-232 connector and launching the Cirrus FlexGUI software enables the CDB43L21 in Software Mode.

2. SOFTWARE MODE CONTROL

The CDB43L21 may be used with the Microsoft® Windows-based FlexGUI graphical user interface, allowing software control of the CS43L21 and FPGA registers. The latest control software may be downloaded from www.cirrus.com/mssoftware. Step-by-step instructions for setting up the FlexGUI are provided as follows:

1. Download and install the FlexGUI software according to the instructions provided on the Website.
2. Connect and apply power to the +5.0 V binding post.
3. Connect the CDB to the host PC using either a 9-pin serial or USB cable.
4. Launch the Cirrus FlexGUI. *Once the GUI is launched successfully, all registers are set to their default reset state.*
5. Enable the CS43L21 by engaging the “Enable CS43L21” push-button.
6. Refresh the GUI by clicking on the “Update” button. *The default state of all registers are now visible.*
7. Engage and then disengage the “Power Down” push-button in the “General Configurations” group. *This performs the necessary write sequence to the CS43L21 for Software Mode operation.*

For standard setup:

8. Set up the signal routing in the “General Configurations” tab as desired.
9. Set up the CS43L21 in the “General Configurations” and “DAC Volume Controls” tab as desired.
10. Begin evaluating the CS43L21.

For quick setup, the CDB43L21 may be configured by loading a predefined sample script file:

11. On the File menu, click "Restore Board Registers..."
12. Browse to Boards\CDB43L21\Scripts\.
13. Choose any one of the provided scripts to begin evaluation.

To create personal scripts files:

14. On the File menu, click "Save Board Registers..."
15. Enter any name that sufficiently describes the created setup.
16. Choose the desired location and save the script.
17. To load this script, follow the instructions from step 11 above.

2.1 General Configuration Tab

The “General Configuration” tab provides high-level control of signal routing on the CDB43L21. This tab also includes basic controls for the CS43L21 for quickly setting up the CDB43L21 in simple configurations. Status text detailing the CS43L21’s specific configuration is shown in parenthesis or appears directly below the associated control. This text may change depending on the setting of the associated control. A description of each control group is outlined below:

CS43L21 Basic Configuration - Includes basic register controls in the CS43L21 used for setting up power status, interface format and clocking functions. See [Section 2.2](#) and [Section 2.3](#) for more controls in the CS43L21.

S/PDIF Receiver Control - Includes all available Hardware Mode controls for setting up the CS8415.

Clock/Data Routing and CS43L21 Reset - Includes controls used for routing clocks and data between the CS43L21, CS8415, oscillator and the I/O stake header. Also includes a reset control for the CS43L21.

Update - Reads all registers in the FPGA and CS43L21 and reflects the current values in the GUI.

Reset - Resets FPGA to default routing configuration.

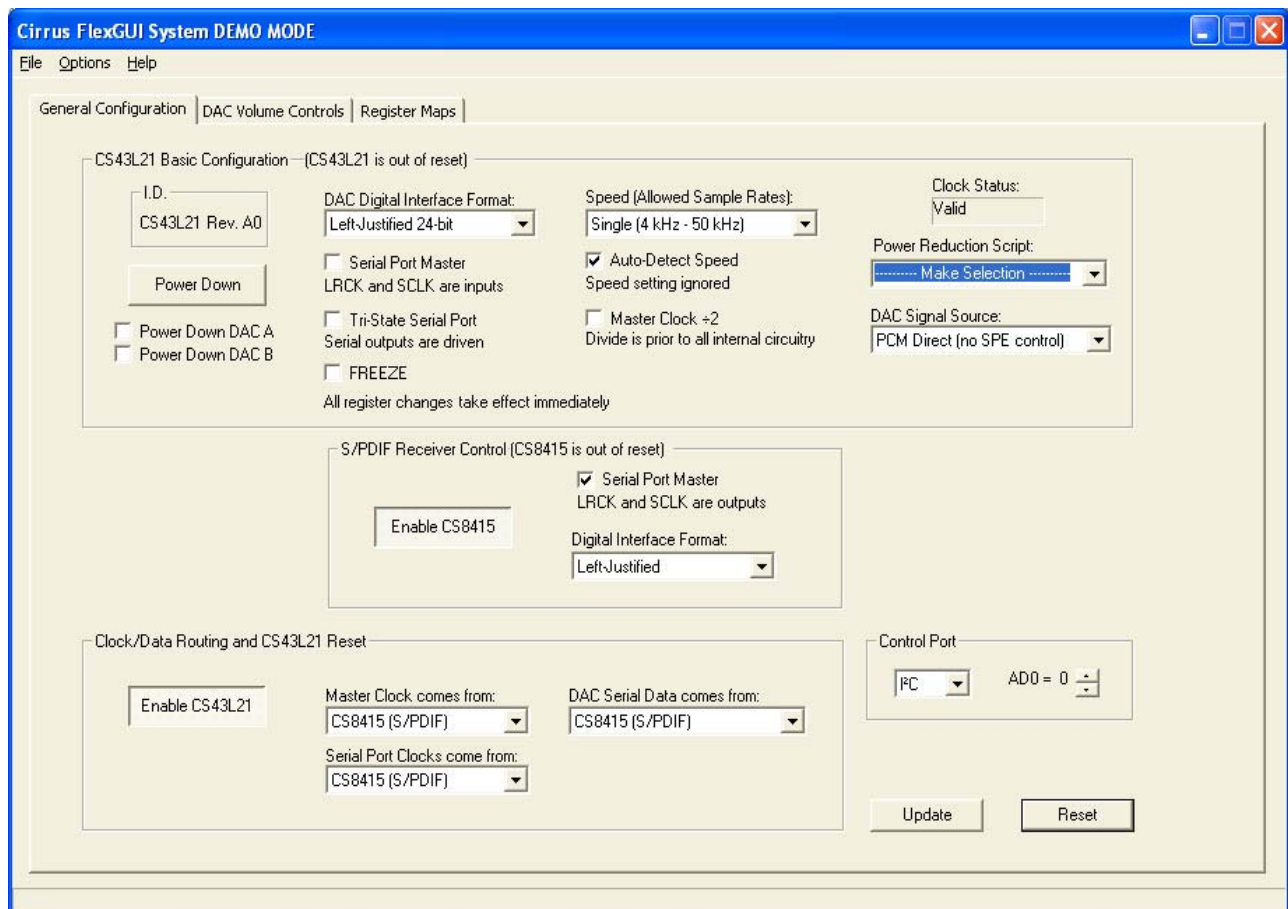

Figure 1. General Configuration Tab

2.2 DAC Volume Controls Tab

The “DAC Volume Controls” tab provides high-level control of all volume settings in the CS43L21. Status text detailing the CS43L21’s specific configuration is shown in read-only edit boxes, in parenthesis, or it appears directly below the associated control. This text will change depending on the setting of the associated control. A description of each control group is outlined below (a description of each register is included in the CS43L21 data sheet):

Digital Volume Control - Includes all digital volume controls and adjustments for the DAC.

Analog Multipliers - Includes the control for the analog gain of the output amplifier and displays the full-scale output factors.

Limiter Configuration - Includes all configuration settings for the Limiter.

Tone Control - Includes all bass and treble boosting controls and adjustments.

BEEP Generator - Includes all configuration settings for the BEEP generator.

Update - Reads all registers in the CS43L21 and reflects the current values in the GUI.

Reset - Resets the CS43L21.

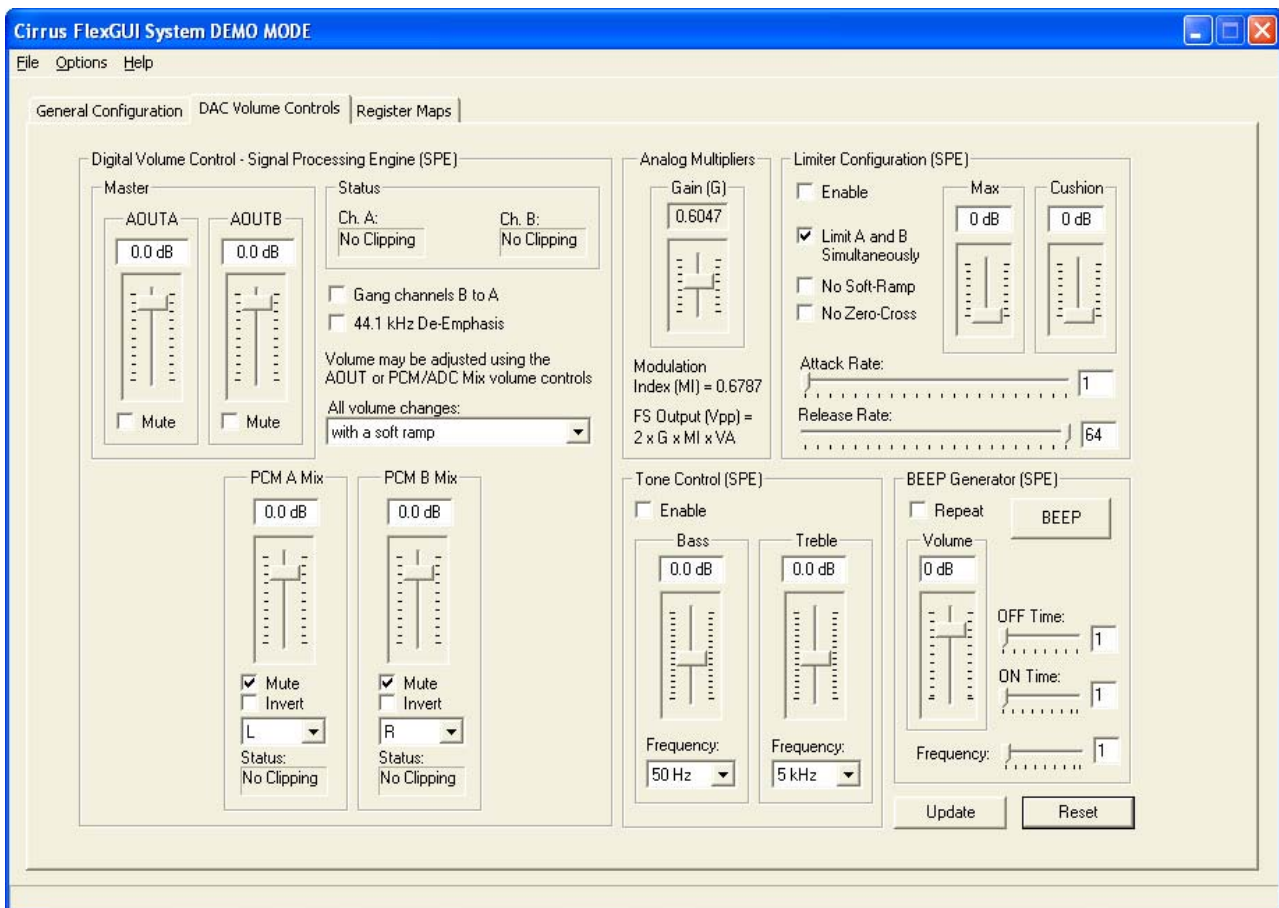

Figure 2. DAC Volume Controls Tab

2.3 Register Maps Tab

The Advanced Register Debug tab provides low-level control of the CS43L21 individual register settings. Register values can be modified bit-wise or byte-wise. For bit-wise, click the appropriate push-button for the desired bit. For byte-wise, the desired hex value can be typed directly into the register address box in the register map. The “FPGA” and “GPIO” tabs may be ignored.

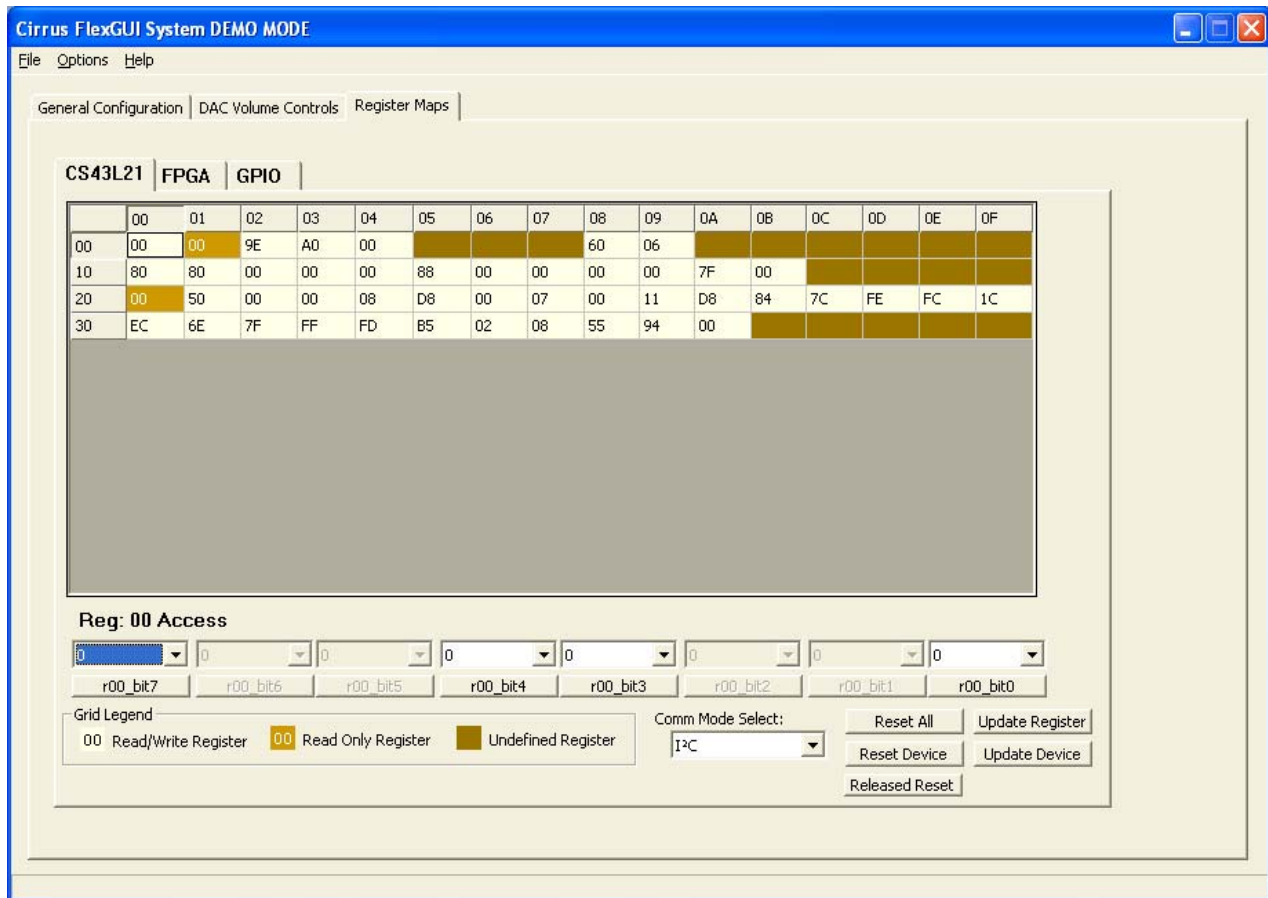

Figure 3. Register Maps Tab - CS43L21

3. HARDWARE MODE CONTROL

The CDB may be configured without the use of a software control port through the use of two switches, “FPGA H/W Control” and “CS43L21 H/W Control.” These switches are enabled in Hardware Mode only and ignored in Software Mode. The CDB43L21 automatically enters Hardware Mode upon initial power up, when exiting Software Mode, upon termination of the Cirrus FlexGUI software, or by disconnecting the RS-232 serial cable.

3.1 FPGA H/W Control

The “FPGA H/W Control” switch sets up the CDB in 11 pre-defined routing topologies in Hardware Mode. The tables and figures below describe each switch setting. The At-A-Glance Controls table provides a quick reference for all presets.

At-A-Glance Controls		
S[3:2]	S[1]	S[0]
00 - CS8415 MCLK / CS8415 clocks/data route through FPGA 01 - I/O Header MCLK / I/O Header clocks/data route through FPGA 10 - Oscillator MCLK / I/O Header clocks/data route through FPGA 11 - Reserved	0 - CS43L21 Slave Routing 1 - CS43L21 Master Routing	0 - Normal Operation 1 - Reserved

Table 1. MCLK and Clock/Data Routing Options

3.2 CS43L21 H/W Control

The stand-alone “CS43L21 H/W Control” switch controls the Hardware Mode options of the CS43L21. A description of each switch is outlined in the following table:

Switch	Position	Function
M/S	LO	LRCK and SCLK are inputs to CS43L21
	HI	LRCK and SCLK are outputs to CS43L21
MCLKDIV2	LO	Internal MCLK to CS43L21 not divided
	HI	Internal MCLK to CS43L21 divided by 2
I2S/LJ	LO	CS43L21 Interface Format: Left-Justified
	HI	CS43L21 Interface Format: I ² S
DE-EMPHASIS	LO	No internal De-emphasis applied to CS43L21
	HI	44.1 kHz internal De-emphasis applied to CS43L21

9. ERRATA

The CDB43L21 currently does not support the +1.8 V and +2.5 V power supply options on header J31 (VL). This header must be set to +3.3 V to ensure correct board operation. This issue is not device related; the allowed voltage levels are specified in the CS43L21 data sheet.

Cirrus owns the copyrights associated with the information contained herein and gives consent for copies to be made of the information only for use within your organization with respect to Cirrus integrated circuits or other products of Cirrus. This consent does not extend to other copying such as copying for general distribution, advertising or promotional purposes, or for creating any work for resale.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). CIRRUS PRODUCTS ARE NOT DESIGNED, AUTHORIZED OR WARRANTED FOR USE IN PRODUCTS SURGICALLY IMPLANTED INTO THE BODY, AUTOMOTIVE SAFETY OR SECURITY DEVICES, LIFE SUPPORT PRODUCTS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF CIRRUS PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK AND CIRRUS DISCLAIMS AND MAKES NO WARRANTY, EXPRESS, STATUTORY OR IMPLIED, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSE, WITH REGARD TO ANY CIRRUS PRODUCT THAT IS USED IN SUCH A MANNER. IF THE CUSTOMER OR CUSTOMER'S CUSTOMER USES OR PERMITS THE USE OF CIRRUS PRODUCTS IN CRITICAL APPLICATIONS, CUSTOMER AGREES, BY SUCH USE, TO FULLY INDEMNIFY CIRRUS, ITS OFFICERS, DIRECTORS, EMPLOYEES, DISTRIBUTORS AND OTHER AGENTS FROM ANY AND ALL LIABILITY, INCLUDING ATTORNEYS' FEES AND COSTS, THAT MAY RESULT FROM OR ARISE IN CONNECTION WITH THESE USES.
