# mail

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

### CDB5341

## **Evaluation Board for CS5341**

#### Features

- Demonstrates recommended layout and grounding arrangements
- CS8406 generates S/PDIF, and EIAJ-340 compatible digital audio
- Requires only an analog signal source and power supplies for a complete Analog-to-Digital-Converter system

#### Description

The CDB5341 evaluation board is an excellent means for quickly evaluating the CS5341 24-bit, stereo A/D converter. Evaluation requires a digital signal analyzer, an analog signal source, and a power supply.

Also included is a CS8406 digital audio interface transmitter which generates S/PDIF, and EIAJ-340 compatible audio data. The digital audio data is available via RCA phono and optical connectors.

ORDERING INFORMATION CDB5341 E

#### 1. CDB5341 SYSTEM OVERVIEW

The CDB5341 evaluation board is an excellent means of quickly evaluating the CS5341. The CS8406 digital audio interface transmitter provides an easy interface to digital audio signal analyzers including the majority of digital audio test equipment.

The CDB5341 schematic has been partitioned into 5 schematics shown in Figure 2 through Figure 6. Each partitioned schematic is represented in the system diagram shown in Figure 1. Notice that the system diagram also includes the interconnections between the partitioned schematics.

#### 2. CS8406 DIGITAL AUDIO TRANSMITTER

The system generates and encodes standard S/PDIF data using a CS8406 Digital Audio Transmitter (see Figure 5). The outputs of the CS8406 are RS422 compatible differential line drivers. The CS8406 supports both Left Justified and I<sup>2</sup>S data formats, as determined by the DIP switch, S2. A description of the CS8406 is included in the CS8406 datasheet.

#### 3. INPUT/OUTPUT FOR CLOCKS AND DATA

The evaluation board has been designed to allow interfacing to external systems via the 10-pin header, J11. The schematic for the clock/data input/output is shown in Figure 4.

The CDB5341 allows some flexibility as to the generation of the clocks. When the CS5341 and CS8406 are in slave mode, the SCLK and LRCK must be provided via the header, J11. MCLK can be generated from the on-board oscillator, Y1 or provided via the header, J11 as determined by the DIP switch, S2. The on-board oscillator is socketed to allow other frequency oscillators to be used. Please note that the on-board oscillator must be removed if an external MCLK is provided through header J11.

#### 4. POWER SUPPLY CIRCUITRY

Power is supplied to the evaluation board by four binding posts (VA/VD, VL, GND, +5V), see Figure 6. The VA/VD input supplies the VA and VD pins of the CS5341. VL supplies power to the VL pin of the CS5341 and to the level shifter circuits. The +5V input supplies power to the digital circuitry and the input amplifiers.

#### 5. GROUNDING AND POWER SUPPLY DECOUPLING

The CS5341 requires careful attention to power supply and grounding arrangements to optimize performance. Figure 3 details the power distribution used on this board. The decoupling capacitors are located as close to the CS5341 as possible. Extensive use of ground plane fill in the evaluation board yields large reductions in radiated noise.

#### 6. ANALOG INPUT FILTER

The CDB5341 implements a single-ended analog input buffer, as shown in Figure 2. Note that there is no attenuation or gain associated with the input buffer.

| CONNECTOR      | INPUT/OUTPUT | SIGNAL PRESENT                      |
|----------------|--------------|-------------------------------------|
| VA/VD          | Input        | +3.3V to +5V power for the CS5341   |
| VL             | Input        | +2.5V to +5V power for the CS5341   |
| GND            | Input        | Ground connection from power supply |
| +5V            | Input        | + 5 Volt power                      |
| AINL           | Input        | Analog input left channel           |
| AINR           | Input        | Analog input right channel          |
| Optical Output | Output       | Digital audio output                |
| Coax Output    | Output       | Digital audio output                |
