SEMICONDUCTORIM	Revised January 2001
CGS3321 • CGS3322 CMOS Crystal Clock Genera	tors
General Description	Features
The CGS3321 and CGS3322 devices are designed for Clock Generation and Support (CGS) applications up to 110 MHz. The CGS332x series of devices are crystal con- trolled CMOS oscillators requiring a minimum of external components. The 332x devices provide selectable output divide ratio. The circuit is designed to operate over a wide frequency range using fundamental mode or overtone crys- tals.	 Fairchild's CGS family of devices for high frequency clock source applications Crystal frequency operation range: fundamental: 10 MHz to 100 MHz typical 3rd or 5th overtone: 10 MHz to 95 MHz 1000V ESD protection on OCS_IN and OSC_OUT pins. 2000V ESD protection on all other pins Output current drive of 48 mA for I_{OL}/I_{OH} FACT™ CMOS output levels Output has high speed short circuit protection Intended for Pierce oscillator applications Hysteresis inputs to improve noise margin CGS3321 has duty cycle adjust CGS3322 has 1, 2, 4 divide ratio

Pin Descriptions

Note: Pin o	out varies for each device.		
OSC_IN	Input to Oscillator Inverter. The output of the crystal would be connected here.	OEH	Active HIGH 3-STATE enable pin. This pin pulls to a HIGH value when left floating and 3- STATEs the output when forced LOW. This pin has TTL compatible input levels.
OSC_OUT	Resistive Buffered Output of the Oscillator Inverter	OUT	This pin is the main clock output on the device.
DIVB	(CGS3322 only) 3-Level input used to select Binary Divide-by value of output frequency.	OSCLO_1	The Oscillator LOW pin is the ground for the Oscillator.
DC_ADJ	(CGS3321 only)	V _{CC}	The power pin for the chip.
	Active high input that controls output duty cycle. Logic high level will delay the HL transition edge approximately 0.3 ns.	GND	The ground pin for all sections of the circuitry except the oscillator and oscillator related circuitry.

Note: Pin out varies for each device.
