imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Clock Generator for Intel[®] Grantsdale Chipset

Features

- Supports Intel[®] P4 and Prescott CPU
- Selectable CPU frequencies
- Differential CPU clock pairs
- 100-MHz differential SRC clocks
- 96-MHz differential dot clock
- 48-MHz USB clocks
- 33-MHz PCI clock

- Low-voltage frequency select input
- I²C Support with read back capabilities
- Ideal Lexmark Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction
- 3.3V power supply
- 56-pin SSOP package

CPU	SRC	PCI	REF	DOT96	USB_48

Pin Configuration

Pin Definitions

Pin No.	Name	Туре	Description
47,46,44,43	CPUT/C	O, DIF	Differential CPU clock outputs.
39,38	CPUT2_ITP/SRCT6, CPUC2_ITP/SRCC6	O, DIF	Selectable Differential CPU or SRC clock output. ITP_EN = 0 @ VTT_PWRGD# assertion = SRC6 ITP_EN = 1 @ VTT_PWRGD# assertion = CPU2
16,17	DOT96T, DOT96C	O, DIF	Fixed 96-MHz clock output.
55, 54	REF0/FS_C, REF1/FS_A	I/O	14.318-MHz reference clock/3.3V-tolerant input for CPU frequency selection. Input is latched upon assertion (LOW) of VTT_PWRGD#/PD Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.
14	USB48/FS_B	I/O	Fixed 48-MHz USB clock output/3.3V-tolerant input for CPU frequency selection. Input is latched upon assertion (LOW) of VTT_PWRGD#/PD Refer to DC Electrical Specifications table for Vil_FS and Vih_FS specifications.
42	IREF	I	A precision resistor is attached to this pin, which is connected to the internal current reference.
1,2,5,6,7,8	PCI[0:5]	O, SE	33-MHz clocks.
11	TEST_SEL/PCIF0	I/O	Free-running 33-MHz clocks/ 3.3V-tolerant input for selecting test mode. Input is latched upon assertion (LOW) of VTT_PWRGD#/PD 1 = All outputs are three-stated for test 0 = All outputs normal operation **This input has an internal pull-down resistor.
12	ITP_EN/PCIF1	I/O, SE	Free-running 33-MHz clock/CPU2 select (sampled on the VTT_PWRGD# assertion). 1 = CPU2_ITP, 0 = SRC6
49	SCLK	I	SMBus-compatible SCLOCK.
50	SDATA	I/O	SMBus-compatible SDATA.
27,28	SATAT, SATAC	O, DIF	Differential serial reference clock. Recommended output for SATA.
19,20,21,22, 25,26,30,31, 32,33,35,36	SRCT/C[0:5]	O, DIF	Differential serial reference clocks.
13	VDD_48	PWR	3.3V power supply for outputs.
45	VDD_CPU	PWR	3.3V power supply for outputs.
3,10	VDD_PCI	PWR	3.3V power supply for outputs.
56	VDD_REF	PWR	3.3V power supply for outputs.
23,29,37	VDD_SRC	PWR	3.3V power supply for outputs.
40	VDD_A	PWR	3.3V power supply for PLL.
15	GND_48	GND	Ground for outputs.
48	GND_CPU	GND	Ground for outputs.
4,9	GND_PCI	GND	Ground for outputs.
53	GND_REF	GND	Ground for outputs.
24,34	GND_SRC	GND	Ground for outputs.
41	GND_A	GND	Ground for PLL.
18	VTT_PWRGD#/PD	I, PU	3.3V LVTTL input is a level sensitive strobe used to latch the REF0/FSC, REF1/FSA, USB48/FSB, TEST_SEL/PCIF0 and ITP_EN/PCIF1 inputs . After VTT_PWRGD# (active LOW) assertion, this pin becomes a realtime input for asserting power-down (active HIGH).
52	X1	I	14.318-MHz crystal input.
51	X2	O, SE	14.318-MHz crystal output.

Frequency Select Pins (FS_A, FS_B and FS_C)

Host clock frequency selection is achieved by applying the appropriate logic levels to FS_A, FS_B, FS_C inputs prior to VTT_PWRGD# assertion (as seen by the clock synthesizer). Upon VTT_PWRGD# being sampled low by the clock chip (indicating processor VTT voltage is stable), the clock chip samples the FS_A, FS_B and FS_C input values. For all logic levels of FS_A, FS_B and FS_C VTT_PWRGD# employs a one-shot functionality in that once a valid low on VTT_PWRGD# has been sampled, all further VTT_PWRGD#, FS_A, FS_B and FS_C transitions will be ignored, except in test mode.

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the Serial Data Interface initial-

Table 1. Frequency Select Table (FS_A, FS_B, FS_C)

izes to their default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 2*.

The block write and block read protocol is outlined in *Table 3* while *Table 4* outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

FS_C	FS_B	FS_A	CPU	SRC	PCIF/PCI	REF0	DOT96	USB

Crystal Recommendations

The CY28412 requires a **Parallel Resonance Crystal**. Substituting a series resonance crystal will cause the CY28412 to operate at the wrong frequency and violate the ppm specification. For most applications there is a 300-ppm frequency shift between series and parallel crystals due to incorrect loading.

Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, the total capacitance the crystal will see must be considered to calculate the appropriate capacitive loading (CL).

The following diagram shows a typical crystal configuration using the two trim capacitors. An important clarification for the following discussion is that the trim capacitors are in series with the crystal not parallel. It's a common misconception that load capacitors are in parallel with the crystal and should be approximately equal to the load capacitance of the crystal. This is not true.

Table 5. Crystal Recommendations

Frequency (Fund)	Cut	Loading	Load Cap	Drive (max.)	Shunt Cap (max.)	Motional (max.)	Tolerance (max.)	Stability (max.)	Aging (max.)
14.31818 MHz	AT	Parallel	20 pF	0.1 mW	5 pF	0.016 pF	50 ppm	50 ppm	5 ppm

Figure 1. Crystal Capacitive Clarification

Calculating Load Capacitors

In addition to the standard external trim capacitors, trace capacitance and pin capacitance must also be considered to correctly calculate crystal loading. As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitive loading on both sides.

As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This mean the total capacitance on each side of the crystal must be 2 times the specified load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitance loading on both sides.

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$Ce = 2 * CL - (Cs + Ci)$$

Total Capacitance (as seen by the crystal)

$$CLe = \frac{1}{\left(\frac{1}{Ce1 + Cs1 + Ci1} + \frac{1}{Ce2 + Cs2 + Ci2}\right)}$$

CL	Crystal load capacitance
CLe using standard value trim capa	Actual loading seen by crystal citors
Ce	External trim capacitors
Cs	Stray capacitance (terraced)
Ci	Internal capacitance
(lead frame, bond wires etc.)	

PD (Power-down) Clarification

The VTT_PWRGD# /PD pin is a dual function pin. During initial power-up, the pin functions as VTT_PWRGD#. Once VTT_PWRGD# has been sampled low by the clock chip, the pin assumes PD functionality. The PD pin is an asynchronous active high input used to shut off all clocks cleanly prior to shutting off power to the device. This signal is synchronized internal to the device prior to powering down the clock synthesizer. PD is also an asynchronous input for powering up the system. When PD is asserted high, all clocks are driven to a low value and held prior to turning off the VCOs and the crystal oscillator.

PD (Power-down) - Assertion

When PD is sampled high by two consecutive rising edges of CPUC, all single-ended outputs will be held low on their next high to low transition and differential clocks must be held high or Hi-Z (depending on the state of the control register drive mode bit) on the next diff clock# high to low transition. When the SMBus PD drive mode bit corresponding to the differential

Figure 2. Crystal Loading Example

(CPU, SRC, and DOT) clock output of interest is programmed to '0', the clock output must be held with "Diff clock" pin driven high at 2 x Iref, and "Diff clock#" tristate. If the control register PD drive mode bit corresponding to the output of interest is programmed to "1", then both the "Diff clock" and the "Diff clock#" are Hi-Z. Note the example below shows CPUT = 133 MHz and PD drive mode = '1' for all differential outputs. This diagram and description is applicable to valid CPU frequencies 100,133,166,200,266,333, and 400 MHz. In the event that PD mode is desired as the initial power-on state, PD must be asserted high in less than 10 μ s after asserting VTT_PWRGD#.

PD Deassertion

The power-up latency is less than 1.8 ms. This is the time from the deassertion of the PD pin or the ramping of the power supply until the time that stable clocks are output from the clock chip. All differential outputs stopped in a tristate condition resulting from power down must be driven high in less than 300 μ s of PD deassertion to a voltage greater than 200 mV. After the clock chip's internal PLL is powered up and locked, all outputs are enabled within a few clock cycles of each other. Below is an example showing the relationship of clocks coming up.

Figure 4. Power-down Deassertion Timing Waveform

Figure 6. Clock Generator Power-up/Run State Diagram

Absolute Maximum Conditions

Parameter	Description	Condition	Min.	Max.	Unit
V _{DD}	Core Supply Voltage		-0.5	4.6	V
