

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

**CY7C056V**  
**CY7C057V**

# 3.3 V 16K/32K × 36 FLEx36™ Asynchronous Dual-Port Static RAM

## Features

- True dual-ported memory cells that allow simultaneous access of the same memory location
- 16K × 36 organization (CY7C056V)
- 32K × 36 organization (CY7C057V)
- 0.25-micron Complimentary metal oxide semiconductor (CMOS) for optimum speed/power
- High-speed access: 12/15 ns
- Low operating power
  - Active:  $I_{CC} = 250$  mA (typical)
  - Standby:  $I_{SB3} = 10$   $\mu$ A (typical)
- Fully asynchronous operation
- Automatic power-down
- Expandable data bus to 72 bits or more using Master/Slave Chip Select when using more than one device
- On-chip arbitration logic
- Semaphores included to permit software handshaking between ports
- $\overline{INT}$  flag for port-to-port communication
- Byte select on left port
- Bus matching on right port
- Depth expansion via dual chip enables
- Pin select for Master or Slave
- Commercial and Industrial temperature ranges
- Available in 144-pin thin quad plastic flatpack (TQFP) or 172-ball ball grid array (BGA)

- Pb-free packages available
- Compact packages:
  - 144-pin TQFP (20 × 20 × 1.4 mm)
  - 172-ball BGA (1.0-mm pitch) (15 × 15 × 0.51 mm)

## Functional Description

The CY7C056V and CY7C057V are low-power CMOS 16K and 32K × 36 dual-port static RAMs. Various arbitration schemes are included on the devices to handle situations when multiple processors access the same piece of data. Two ports are provided, permitting independent, asynchronous access for reads and writes to any location in memory. The devices can be utilized as standalone 36-bit dual-port static RAMs or multiple devices can be combined in order to function as a 72-bit or wider master/slave dual-port static RAM. An M/S pin is provided for implementing 72-bit or wider memory applications without the need for separate master and slave devices or additional discrete logic. Application areas include interprocessor/multiprocessor designs, communications status buffering, and dual-port video/graphics memory.

Each port has independent control pins: Chip Enable ( $\overline{CE}$ ) [1], Read or Write Enable (R/W), and Output Enable ( $\overline{OE}$ ). Two flags are provided on each port (BUSY and INT). BUSY signals that the port is trying to access the same location currently being accessed by the other port. The Interrupt Flag (INT) permits communication between ports or systems by means of a mailbox. The semaphores are used to pass a flag, or token, from one port to the other to indicate that a shared resource is in use. The semaphore logic is comprised of eight shared latches. Only one side can control the latch (semaphore) at any time. Control of a semaphore indicates that a shared resource is in use. An automatic Power-down feature is controlled independently on each port by Chip Select ( $\overline{CE}_0$  and  $\overline{CE}_1$ ) pins.

The CY7C056V and CY7C057V are available in 144-pin TQFP and 172-ball BGA packages.

## Selection Guide

Description	CY7C056V CY7C057V -12	CY7C056V CY7C057V -15	Unit
Maximum access time	12	15	ns
Typical operating current	250	240	mA
Typical standby current for $I_{SB1}$ (Both ports TTL level)	55	50	mA
Typical standby current for $I_{SB3}$ (Both ports CMOS level)	10	10	$\mu$ A

**Note**

1.  $\overline{CE}$  is LOW when  $\overline{CE}_0 \leq V_{IL}$  and  $\overline{CE}_1 \geq V_{IH}$ .

## Logic Block Diagram

### Notes

2.  $A_0-A_{13}$  for 16K;  $A_0-A_{14}$  for 32K devices.
3. BUSY is an output in Master mode and an input in Slave mode.

$V_{DD}$		Power

## Architecture

The CY7C056V and CY7C057V consist of an array of 16K and 32K words of 36 bits each of dual-port RAM cells, I/O and address lines, and control signals ( $\overline{CE}_0/\overline{CE}_1$ ,  $\overline{OE}$ , R/W). These control pins permit independent access for reads or writes to any location in memory. To handle simultaneous writes/reads to the same location, a  $\overline{BUSY}$  pin is provided on each port. Two Interrupt (INT) pins can be utilized for port-to-port communication. Two Semaphore (SEM) control pins are used for allocating shared resources. With the M/S pin, the devices can function as a master ( $\overline{BUSY}$  pins are outputs) or as a slave ( $\overline{BUSY}$  pins are inputs). The devices also have an automatic power-down feature controlled by  $\overline{CE}_0/\overline{CE}_1$ . Each port is provided with its own Output Enable control ( $\overline{OE}$ ), which allows data to be read from the device.

## Functional Overview

### Write Operation

Data must be set up for a duration of  $t_{SD}$  before the rising edge of R/W in order to guarantee a valid write. A write operation is controlled by either the R/W pin (see Write Cycle No. 1 waveform) or the  $\overline{CE}_0$  and  $\overline{CE}_1$  pins (see Write Cycle No. 2 waveform). Required inputs for non-contention operations are summarized in Table 1. If a location is being written to by one port and the opposite port attempts to read that location, a port-to-port flowthrough delay must occur before the data is read on the output; otherwise the data read is not deterministic. Data will be valid on the port  $t_{DD}$  after the data is presented on the other port.

**Table 1. Non-Contending Read/Write** <sup>[6]</sup>

Inputs					Outputs	Operation
CE	R/W	OE	B <sub>0</sub> , B <sub>1</sub> , B <sub>2</sub> , B <sub>3</sub>	SEM	I/O <sub>0</sub> -I/O <sub>35</sub>	
H	X	X	X	H	High Z	Deselected: Power-down
X	X	X	All H	H	High Z	Deselected: Power-down
L	L	X	H/L	H	Data in and High Z	Write to selected bytes only
L	L	X	All L	H	Data in	Write to all bytes
L	H	L	H/L	H	Data out and High Z	Read selected bytes only
L	H	L	All L	H	Data out	Read all bytes
X	X	H	X	X	High Z	Outputs disabled
H	H	L	X	L	Data out	Read data in semaphore flag
X	H	L	All H	L	Data out	Read data in semaphore flag
H		X	X	L	Data in	Write D <sub>IN0</sub> into semaphore flag
X		X	All H	L	Data in	Write D <sub>IN0</sub> into semaphore flag
L	X	X	Any L	L		Not allowed

### Read Operation

When reading the device, the user must assert both the  $\overline{OE}$  and  $\overline{CE}^{[6]}$  pins. Data will be available  $t_{ACE}$  after  $\overline{CE}$  or  $t_{DOE}$  after  $\overline{OE}$

is asserted. If the user wishes to access a semaphore flag, then the SEM pin must be asserted instead of the  $\overline{CE}^{[6]}$  pin, and  $\overline{OE}$  must also be asserted.

#### Note

6.  $\overline{CE}$  is LOW when  $\overline{CE}_0 \leq V_{IL}$  and  $\overline{CE}_1 \geq V_{IH}$ .

## Interrupts

The upper two memory locations may be used for message passing. The highest memory location (3FFF for the CY7C056V, 7FFF for the CY7C057V) is the mailbox for the right port and the second-highest memory location (3FFE for the CY7C056V, 7FFE for the CY7C057V) is the mailbox for the left port. When one port writes to the other port's mailbox, an interrupt is generated to the owner. The interrupt is reset when the owner reads the contents of the mailbox. The message is user defined.

Each port can read the other port's mailbox without resetting the interrupt. The active state of the busy signal (to a port) prevents the port from setting the interrupt to the winning port. Also, an active busy to a port prevents that port from reading its own mailbox and, thus, resetting the interrupt to it.

If an application does not require message passing, do not connect the interrupt pin to the processor's interrupt request input pin. The operation of the interrupts and their interaction with Busy are summarized in [Table 2](#).

**Table 2. Interrupt Operation Example (assumes  $\overline{\text{BUSY}}_L = \overline{\text{BUSY}}_R = \text{HIGH}$ )** [7, 8]

Function	Left Port					Right Port				
	R/W <sub>L</sub>	CE <sub>L</sub>	OE <sub>L</sub>	A <sub>0L-13L/14L</sub>	INT <sub>L</sub>	R/W <sub>R</sub>	CE <sub>R</sub>	OE <sub>R</sub>	A <sub>0R-13R/14R</sub>	INT <sub>R</sub>
Set right $\overline{\text{INT}}_R$ flag	L	L	X	3FFF (7FFF)	X	X	X	X	X	L <sup>[9]</sup>
Reset right $\overline{\text{INT}}_R$ flag	X	X	X	X	X	X	L	L	3FFF (7FFF)	H <sup>[10]</sup>
Set left $\overline{\text{INT}}_L$ flag	X	X	X	X	L <sup>[10]</sup>	L	L	X	3FFE (7FFE)	X
Reset left $\overline{\text{INT}}_L$ flag	X	L	L	3FFE (7FFE)	H <sup>[9]</sup>	X	X	X	X	X

## Busy

The CY7C056V and CY7C057V provide on-chip arbitration to resolve simultaneous memory location access (contention). If both ports' Chip Enables are asserted and an address match occurs within  $t_{PS}$  of each other, the busy logic will determine which port has access. If  $t_{PS}$  is violated, one port will definitely gain permission to the location, but it is not predictable which port will get that permission.  $\overline{\text{BUSY}}$  will be asserted  $t_{BLA}$  after an address match or  $t_{BLC}$  after CE is taken LOW.

## Master/Slave

A  $\overline{\text{M/S}}$  pin is provided in order to expand the word width by configuring the device as either a master or a slave. The  $\overline{\text{BUSY}}$  output of the master is connected to the  $\overline{\text{BUSY}}$  input of the slave. This will allow the device to interface to a master device with no external components. Writing to slave devices must be delayed until after the  $\overline{\text{BUSY}}$  input has settled ( $t_{BLC}$  or  $t_{BLA}$ ), otherwise, the slave chip may begin a write cycle during a contention situation. When tied HIGH, the  $\overline{\text{M/S}}$  pin allows the device to be used as a master and, therefore, the  $\overline{\text{BUSY}}$  line is an output.  $\overline{\text{BUSY}}$  can then be used to send the arbitration outcome to a slave.

### Notes

7.  $\overline{\text{CE}}$  is LOW when  $\overline{\text{CE}}_0 \leq V_{IL}$  and  $\text{CE}_1 \geq V_{IH}$ .
8. A<sub>0L-14L</sub> and A<sub>0R-14R</sub>, 7FFF/7FFE for the CY7C057V.
9. If  $\overline{\text{BUSY}}_L = \text{L}$ , then no change.
10. If  $\overline{\text{BUSY}}_R = \text{L}$ , then no change.

### Semaphore Operation

The CY7C056V and CY7C057V provide eight semaphore latches, which are separate from the dual-port memory locations. Semaphores are used to reserve resources that are shared between the two ports. The state of the semaphore indicates that a resource is in use. For example, if the left port wants to request a given resource, it sets a latch by writing a zero to a semaphore location. The left port then verifies its success in setting the latch by reading it. After writing to the semaphore,  $\overline{SEM}$  or  $\overline{OE}$  must be deasserted for  $t_{SOP}$  before attempting to read the semaphore. The semaphore value will be available  $t_{SWRD} + t_{DOE}$  after the rising edge of the semaphore write. If the left port was successful (reads a 0), it assumes control of the shared resource, otherwise (reads a 1) it assumes the right port has control and continues to poll the semaphore. When the right side has relinquished control of the semaphore (by writing a 1), the left side will succeed in gaining control of the semaphore. If the left side no longer requires the semaphore, a one is written to cancel its request.

Semaphores are accessed by asserting  $\overline{SEM}$  LOW. The  $\overline{SEM}$  pin functions as a chip select for the semaphore latches. For

normal semaphore access,  $\overline{CE}^{11}$  must remain HIGH during  $\overline{SEM}$  LOW. A CE active semaphore access is also available. The semaphore may be accessed through the right port with  $\overline{CE}_{0R}/\overline{CE}_{1R}$  active by asserting the Bus Match Select (BM) pin LOW and asserting the Bus Size Select (SIZE) pin HIGH. The semaphore may be accessed through the left port with  $\overline{CE}_{0L}/\overline{CE}_{1L}$  active by asserting all  $\overline{B}_{0-3}$  Byte Select pins HIGH.  $A_{0-2}$  represents the semaphore address.  $\overline{OE}$  and R/W are used in the same manner as a normal memory access. When writing or reading a semaphore, the other address pins have no effect.

When writing to the semaphore, only  $I/O_0$  is used. If a zero is written to the left port of an available semaphore, a 1 will appear at the same semaphore address on the right port. That semaphore can now only be modified by the port showing 0 (the left port in this case). If the left port now relinquishes control by writing a 1 to the semaphore, the semaphore will be set to 1 for both ports. However, if the right port had requested the semaphore (written a 0) while the left port had control, the right port would immediately own the semaphore as soon as the left port released it. Table 3 shows sample semaphore operations.

**Table 3. Semaphore Operation Example**

Function	I/O <sub>0</sub> –I/O <sub>8</sub> Left	I/O <sub>0</sub> –I/O <sub>8</sub> Right	Status
No action	1	1	Semaphore free
Left port writes 0 to Semaphore	0	1	Left port has semaphore token
Right port writes 0 to Semaphore	0	1	No change. Right side has no write access to Semaphore
Left port writes 1 to Semaphore	1	0	Right port obtains semaphore token
Left port writes 0 to Semaphore	1	0	No change. Left port has no write access to semaphore
Right port writes 1 to Semaphore	0	1	Left port obtains semaphore token
Left port writes 1 to Semaphore	1	1	Semaphore free
Right port writes 0 to Semaphore	1	0	Right port has semaphore token
Right port writes 1 to Semaphore	1	1	Semaphore free
Left port writes 0 to Semaphore	0	1	Left port has semaphore token
Left port writes 1 to Semaphore	1	1	Semaphore free

**Note**

11.  $\overline{CE}$  is LOW when  $\overline{CE}_0 \leq V_{IL}$  and  $CE_1 \geq V_{IH}$ .

**Table 4. Right Port Configuration** [12, 13, 14]

BM	SIZE	Configuration	I/O Pins Used
0	0	× 36 (standard)	I/O <sub>0-35</sub>
0	1	× 36 ( $\overline{\text{CE}}$ active SEM mode)	I/O <sub>0-35</sub>
1	0	× 18	I/O <sub>0-17</sub>
1	1	× 9	I/O <sub>0-8</sub>

**Table 5. Right Port Operation**

Configuration	WA	BA	Data Accessed <sup>[15]</sup>	I/O Pins Used
× 36	X	X	DQ <sub>0-35</sub>	I/O <sub>0-35</sub>
× 18	0	X	DQ <sub>0-17</sub>	I/O <sub>0-17</sub>
× 18	1	X	DQ <sub>18-35</sub>	I/O <sub>0-17</sub>
× 9	0	0	DQ <sub>0-8</sub>	I/O <sub>0-8</sub>
× 9	0	1	DQ <sub>9-17</sub>	I/O <sub>0-8</sub>
× 9	1	0	DQ <sub>18-26</sub>	I/O <sub>0-8</sub>
× 9	1	1	DQ <sub>27-35</sub>	I/O <sub>0-8</sub>

**Table 6. Left Port Operation**

Control Pin	Effect
B0	I/O <sub>0-8</sub> Byte control
B1	I/O <sub>9-17</sub> Byte control
B2	I/O <sub>18-26</sub> Byte control
B3	I/O <sub>27-35</sub> Byte control

When reading a semaphore, data lines 0 through 8 output the semaphore value. The read value is latched in an output register to prevent the semaphore from changing state during a write from the other port. If both ports attempt to access the

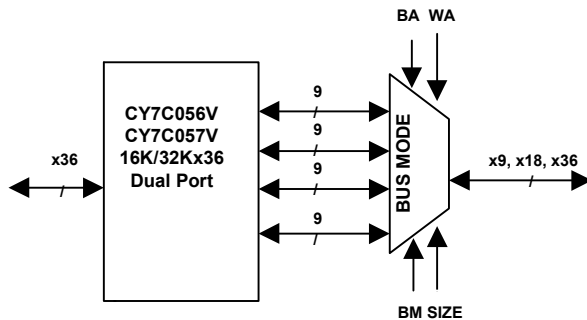

semaphore within  $t_{SPS}$  of each other, the semaphore will definitely be obtained by one side or the other, but there is no guarantee which side will control the semaphore.

**Notes**

- 12. BM and SIZE must be configured one clock cycle before operation is guaranteed.
- 13. In × 36 mode WA and BA pins are "Don't Care."
- 14. In × 18 mode BA pin is a "Don't Care."
- 15. DQ represents data output of the chip.

## Bus Match Operation

The right port of the CY7C057V 32K × 36 dual-port SRAM can be configured in a 36-bit long-word, 18-bit word, or 9-bit byte format for data I/O. The data lines are divided into four lanes, each consisting of 9 bits (byte-size data lines).

The bus match select (BM) pin works with bus size select (SIZE) to select bus width (long-word, word, or byte) for the right port of the dual-port device. The data sequencing arrangement is selected using the word address (WA) and byte address (BA) input pins. A logic “0” applied to both the bus match select (BM) pin and to the bus size select (SIZE) pin will select long-word (36-bit) operation. A logic “1” level applied to the bus match select (BM) pin will enable either byte or word bus width operation on the right port I/Os depending on the logic level applied to the SIZE pin. The level of bus match select (BM) must be static throughout device operation.

Normally, the bus size select (SIZE) pin would have no standard-cycle application when BM = LOW and the device is in long-word (36-bit) operation. A “special” mode has been added however to disable ALL right port I/Os while the chip is active. This I/O disable mode is implemented when SIZE is forced to a logic “1” while BM is at a logic “0”. It allows the bus-matched port to support a chip enable “Don’t care” semaphore read/write access similar to that provided on the left port of the device when all Byte Select ( $\overline{B}_{0-3}$ ) control inputs are deselected.

The bus size select (SIZE) pin selects either a byte or word data arrangement on the right port when the bus match select (BM) pin is HIGH. A logic “1” on the SIZE pin when the BM pin is HIGH selects a byte bus (9-bit) data arrangement). A logic “0” on the SIZE pin when the BM pin is HIGH selects a word bus (18-bit) data arrangement. The level of the bus size select (SIZE) must also be static throughout normal device operation.

### Long-Word (36-bit) Operation

Bus match select (BM) and bus size select (SIZE) set to a logic “0” will enable standard cycle long-word (36-bit) operation. In this mode, the right port’s I/O operates essentially in an identical fashion as does the left port of the dual-port SRAM. However no byte select control is available. All 36 bits of the long-word are shifted into and out of the right port’s I/O buffer stages. All read and write timing parameters may be identical with respect to the two data ports. When the right port is configured for a long-word size, word address (WA), and byte Address (BA) pins have no application and their inputs are “Don’t Care” [16] for the external user.

### Word (18-bit) Operation

Word (18-bit) bus sizing operation is enabled when bus match select (BM) is set to a logic “1” and the bus size select (SIZE) pin is set to a logic “0.” In this mode, 18 bits of data are ported through I/O<sub>0R-17R</sub>. The level applied to the word address (WA) pin during word bus size operation determines whether the most-significant or least-significant data bits are ported through the I/O<sub>0R-17R</sub> pins in an Upper word/Lower word select fashion (note that when the right port is configured for word size operation, the Byte Address pin has no application and its input is “Don’t care” [16]).

Device operation is accomplished by treating the WA pin as an additional address input and using standard cycle address and data setup/hold times. When transferring data in word (18-bit) bus match format, the unused I/O<sub>18R-35R</sub> pins are three-stated.

### Byte (9-bit) Operation

Byte (9-bit) bus sizing operation is enabled when bus match select (BM) is set to a logic “1” and the bus size select (SIZE) pin is set to a logic “1.” In this mode, data is ported through I/O<sub>0R-8R</sub> in four groups of 9-bit bytes. A particular 9-bit byte group is selected according to the levels applied to the word address (WA) and byte address (BA) input pins.

I/Os	Rank	WA	BA
I/O <sub>27R-35R</sub>	Upper-MSB	1	1
I/O <sub>18R-26R</sub>	Lower-MSB	1	0
I/O <sub>9R-17R</sub>	Upper-MSB	0	1
I/O <sub>0R-8R</sub>	Lower-MSB	0	0

Device operation is accomplished by treating the word address (WA) pin and the byte address (BA) pins as additional address inputs having standard cycle address and data set-up/hold times. When transferring data in byte (9-bit) bus match format, the unused I/O<sub>9R-35R</sub> pins are three-stated.

#### Note

16. Even though a logic level applied to a “Don’t Care” input will not change the logical operation of the dual-port, inputs that are temporarily a “Don’t Care” (along with unused inputs) must not be allowed to float. They must be forced either HIGH or LOW.

## Maximum Ratings

Exceeding maximum ratings<sup>[17]</sup> may shorten the useful life of the device. User guidelines are not tested.

Storage temperature .....	-65 °C to +150 °C
Ambient temperature with power applied .....	-55 °C to +125 °C
Supply voltage to ground potential .....	-0.5 V to +4.6 V
DC voltage applied to outputs in High Z state .....	-0.5 V to $V_{DD} + 0.5$ V
DC input voltage .....	-0.5 V to $V_{DD} + 0.5$ V <sup>[18]</sup>

Output current into outputs (LOW) .....	20 mA
Static discharge voltage .....	> 2001 V
Latch-up current .....	> 200 mA

## Operating Range

Range	Ambient Temperature	$V_{DD}$
Commercial	0 °C to +70 °C	3.3 V ± 165 mV
Industrial	-40 °C to +85 °C	3.3 V ± 165 mV

## Electrical Characteristics

Over the Operating Range

Parameter <sup>[19]</sup>	Description	CY7C056V CY7C057V						Unit	
		-12			-15				
		Min	Typ	Max	Min	Typ	Max		
$V_{OH}$	Output HIGH voltage ( $V_{DD} = \text{Min.}$ , $I_{OH} = -4.0$ mA)	2.4	–	–	2.4	–	–	V	
$V_{OL}$	Output LOW voltage ( $V_{DD} = \text{Min.}$ , $I_{OL} = +4.0$ mA)	–	–	0.4	–	–	0.4	V	
$V_{IH}$	Input HIGH voltage	2.0	–	–	2.0	–	–	V	
$V_{IL}$	Input LOW voltage	–	–	0.8	–	–	0.8	V	
$I_{OZ}$	Output leakage current	–10	–	10	–10	–	10	μA	
$I_{CC}$	Operating current ( $V_{DD} = \text{Max.}$ , $I_{OUT} = 0$ mA), output disabled	Commercial	–	250	385	–	240	360	mA
		Industrial	–	–	–	–	265	385	mA
$I_{SB1}$	Standby current (Both ports TTL level and deselected), $f = f_{MAX}$	Commercial	–	55	75	–	50	70	mA
		Industrial	–	–	–	–	65	95	mA
$I_{SB2}$	Standby current (One port TTL level and deselected), $f = f_{MAX}$	Commercial	–	180	240	–	175	230	mA
		Industrial	–	–	–	–	190	255	mA
$I_{SB3}$	Standby current (Both ports CMOS level and deselected), $f = 0$	Commercial	–	0.01	1	–	0.01	1	mA
		Industrial	–	–	–	–	0.01	1	mA
$I_{SB4}$	Standby current (One Port CMOS level and deselected), $f = f_{MAX}$ <sup>[20]</sup>	Commercial	–	160	210	–	155	200	mA
		Industrial	–	–	–	–	170	215	mA

### Notes

17. The voltage on any input or I/O pin can not exceed the power pin during power-up.

18. Pulse width < 20 ns.

19. Deselection for a port occurs if  $\overline{CE}_0$  is HIGH or if  $CE_1$  is LOW.

20.  $f_{MAX} = 1/t_{RC} = \text{All inputs cycling at } f = 1/t_{RC}$  (except Output Enable).  $f = 0$  means no address or control lines change. This applies only to inputs at CMOS level standby  $I_{SB3}$ .

## Capacitance

Parameter <sup>[21]</sup>	Description	Test Conditions	Max	Unit
$C_{IN}$	Input capacitance	$T_A = 25^\circ\text{C}$ , $f = 1\text{ MHz}$ , $V_{DD} = 3.3\text{ V}$	10	pF
$C_{OUT}$	Output capacitance		10	pF

## AC Test Loads and Waveforms

Figure 3. AC Test Loads and Waveforms

(b) Load Derating Curve

### Notes

- 21. Tested initially and after any design or process changes that may affect these parameters.
- 22. External AC Test Load Capacitance = 10 pF.
- 23. (Internal I/O pad Capacitance = 10 pF) + AC Test Load.

## Data Retention Mode

The CY7C056V and CY7C057V are designed with battery backup in mind. Data retention voltage and supply current are guaranteed over temperature. The following rules ensure data retention:

1. Chip Enable ( $\overline{CE}$ )<sup>[24]</sup> must be held HIGH during data retention, within  $V_{DD}$  to  $V_{DD} - 0.2$  V.
2.  $\overline{CE}$  must be kept between  $V_{DD} - 0.2$  V and 70% of  $V_{DD}$  during the power-up and power-down transitions.
3. The RAM can begin operation  $> t_{RC}$  after  $V_{DD}$  reaches the minimum operating voltage (3.15 volts).

## Timing

Parameter	Test Conditions <sup>[25]</sup>	Max	Unit
$I_{CCDR1}$	@ $V_{DDDR} = 2$ V	50	$\mu$ A

### Notes

24.  $\overline{CE}$  is LOW when  $\overline{CE}_0 \leq V_{IL}$  and  $CE_1 \geq V_{IH}$ .

25.  $\overline{CE} = V_{DD}$ ,  $V_{in} = V_{SS}$  to  $V_{DD}$ ,  $T_A = 25$  °C. This parameter is guaranteed but not tested.

## Switching Characteristics

Over the Operating Range

Parameter <sup>[26]</sup>	Description	CY7C056V CY7C057V				Unit
		-12		-15		
		Min	Max	Min	Max	
<b>Read Cycle</b>						
$t_{RC}$	Read cycle time	12	–	15	–	ns
$t_{AA}$	Address to data valid	–	12	–	15	ns
$t_{OHA}$	Output hold from address change	3	–	3	–	ns
$t_{ACE}^{[27, 28]}$	$\overline{CE}$ LOW to data valid	–	12	–	15	ns
$t_{DOE}$	$\overline{OE}$ LOW to data valid	–	8	–	10	ns
$t_{LZOE}^{[27, 29, 30, 31]}$	$\overline{OE}$ Low to low Z	0	–	0	–	ns
$t_{HZOE}^{[27, 29, 30, 31]}$	$\overline{OE}$ HIGH to High Z	–	10	–	10	ns
$t_{LZCE}^{[27, 26, 30, 31]}$	$\overline{CE}$ LOW to Low Z	3	–	3	–	ns
$t_{HZCE}^{[27, 29, 30, 31]}$	$\overline{CE}$ HIGH to High Z	–	10	–	10	ns
$t_{LZBE}$	Byte Enable to Low Z	3	–	3	–	ns
$t_{HZBE}$	Byte Enable to High Z	–	10	–	10	ns
$t_{PU}^{[27, 31]}$	$\overline{CE}$ LOW to power-up	0	–	0	–	ns
$t_{PD}^{[27, 31]}$	$\overline{CE}$ HIGH to power-down	–	12	–	15	ns
$t_{ABE}^{[28]}$	Byte Enable access time	–	12	–	15	ns
<b>Write Cycle</b>						
$t_{WC}$	Write cycle time	12	–	15	–	ns
$t_{SCE}^{[27, 28]}$	$\overline{CE}$ LOW to write end	10	–	12	–	ns
$t_{AW}$	Address valid to write end	10	–	12	–	ns
$t_{HA}$	Address hold from write end	0	–	0	–	ns
$t_{SA}^{[28]}$	Address set-up to write start	0	–	0	–	ns
$t_{PWE}$	Write pulse width	10	–	12	–	ns
$t_{SD}$	Data set-up to write end	10	–	10	–	ns
$t_{HD}$	Data hold from write end	0	–	0	–	ns
$t_{HZWE}^{[30, 31]}$	$R/\overline{W}$ LOW to High Z	–	10	–	–	ns
$t_{LZWE}^{[30, 31]}$	$R/\overline{W}$ HIGH to Low Z	3	–	3	–	ns
$t_{WDD}^{[32]}$	Write pulse to data delay	–	25	–	–	ns
$t_{DDD}^{[32]}$	Write data valid to read data valid	–	20	–	25	ns

### Notes

26. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified  $I_{O1}/I_{OH}$  and 10-pF load capacitance.
27.  $\overline{CE}$  is LOW when  $\overline{CE}_0 \leq V_{IL}$  and  $\overline{CE}_1 \geq V_{IH}$ .
28. To access RAM,  $\overline{CE} = L$  and  $\overline{SEM} = H$ . To access semaphore,  $\overline{CE} = H$  and  $\overline{SEM} = L$ . Either condition must be valid for the entire  $t_{SCE}$  time.
29. At any given temperature and voltage condition for any given device,  $t_{HZCE}$  is less than  $t_{LZCE}$  and  $t_{HZOE}$  is less than  $t_{LZOE}$ .
30. Test conditions used are Load 2.
31. This parameter is guaranteed by design, but it is not production tested. For information on port-to-port delay through RAM cells from writing port to reading port, refer to Read Timing with Busy waveform.
32. For information on port-to-port delay through RAM cells from writing port to reading port, refer to Read Timing with Busy waveform.

## Switching Characteristics (continued)

Over the Operating Range

Parameter <sup>[26]</sup>	Description	CY7C056V CY7C057V				Unit
		-12		-15		
		Min	Max	Min	Max	
<b>Busy Timing</b> <sup>[33]</sup>						
t <sub>BLA</sub>	BUSY LOW from address match	–	12	–	15	ns
t <sub>BHA</sub>	BUSY HIGH from address mismatch	–	12	–	15	ns
t <sub>BLC</sub>	BUSY LOW from CE LOW	–	12	–	15	ns
<b>Busy Timing</b> <sup>[33]</sup>						
t <sub>BHC</sub>	BUSY HIGH from CE HIGH	–	12	–	15	ns
t <sub>PS</sub>	Port set-up for priority	5	–	5	–	ns
t <sub>WB</sub>	R/W LOW after BUSY (Slave)	0	–	0	–	ns
t <sub>WH</sub>	R/W HIGH after BUSY HIGH (Slave)	11	–	13	–	ns
t <sub>BDD</sub> <sup>[34]</sup>	BUSY HIGH to data valid	–	12	–	15	ns
<b>Interrupt Timing</b> <sup>[33]</sup>						
t <sub>INS</sub>	INT set time	–	12	–	15	ns
t <sub>INR</sub>	INT reset time	–	12	–	15	ns
<b>Semaphore Timing</b>						
t <sub>SOP</sub>	SEM flag update pulse (OE or SEM)	10	–	10	–	ns
t <sub>SWRD</sub>	SEM flag write to read time	5	–	5	–	ns
t <sub>SPS</sub>	SEM flag contention window	5	–	5	–	ns
t <sub>SAA</sub>	SEM address access time	–	12	–	15	ns

### Notes

33. Test conditions used are Load 1.

34. t<sub>BDD</sub> is a calculated parameter and is the greater of t<sub>WDD</sub>–t<sub>PWE</sub> (actual) or t<sub>DDDD</sub>–t<sub>SD</sub> (actual).

## Switching Waveforms

Figure 4. Read Cycle No. 1 (Either Port Address Access) [35, 36, 37]

Figure 5. Read Cycle No. 2 (Either Port  $\overline{CE}/\overline{OE}$  Access) [35, 38, 39]

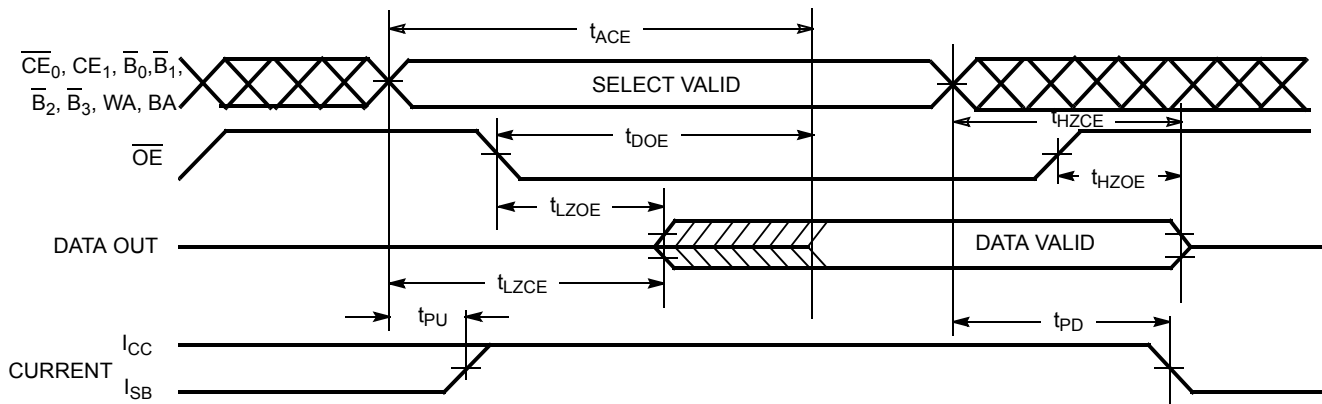

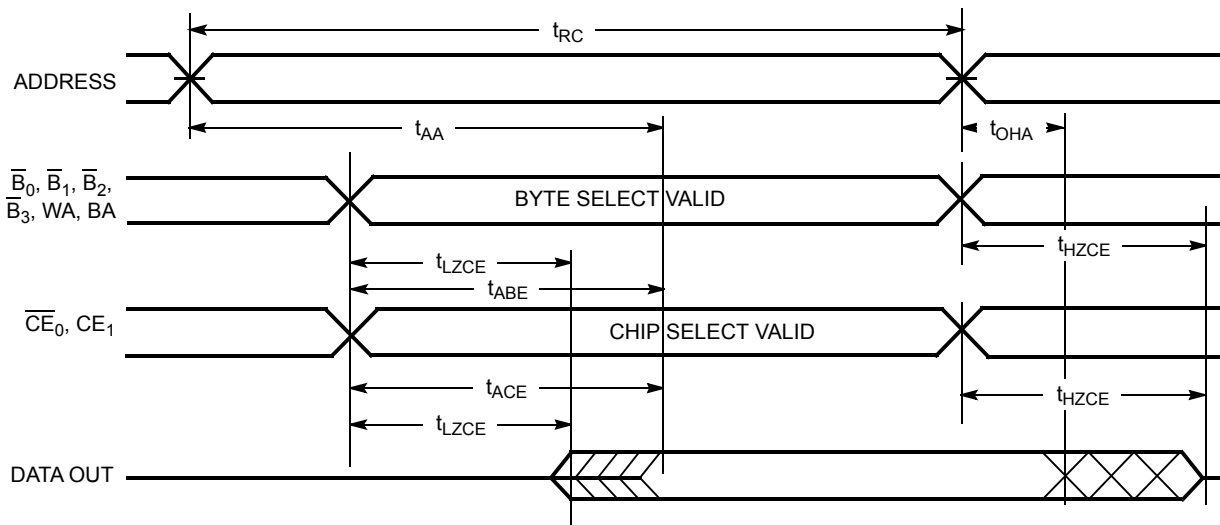

Figure 6. Read Cycle No. 3 (Either Port) [35, 37, 38, 39]

### Notes

35.  $R\overline{W}$  is HIGH for read cycles.
36. Device is continuously selected.  $\overline{CE}_0 = V_{IL}$ ,  $CE_1 = V_{IH}$ , and  $\overline{B}_0, \overline{B}_1, \overline{B}_2, \overline{B}_3, WA, BA$  are valid. This waveform cannot be used for semaphore reads.
37.  $\overline{OE} = V_{IL}$ .
38. Address valid prior to or coinciding with  $\overline{CE}_0$  transition LOW and  $CE_1$  transition HIGH.
39. To access RAM,  $\overline{CE}_0 = V_{IL}, CE_1 = V_{IH}, \overline{B}_0, \overline{B}_1, \overline{B}_2, \overline{B}_3, WA, BA$  are valid, and  $\overline{SEM} = V_{IH}$ . To access semaphore,  $\overline{CE}_0 = V_{IH}, CE_1 = V_{IL}$  and  $\overline{SEM} = V_{IL}$  or  $\overline{CE}_0$  and  $\overline{SEM} = V_{IL}$ , and  $CE_1 = \overline{B}_0 = \overline{B}_1 = \overline{B}_2 = \overline{B}_3 = V_{IH}$ .

Switching Waveforms (continued)

Figure 7. Write Cycle No. 1 (R/W Controlled Timing) [40, 41, 42, 43]

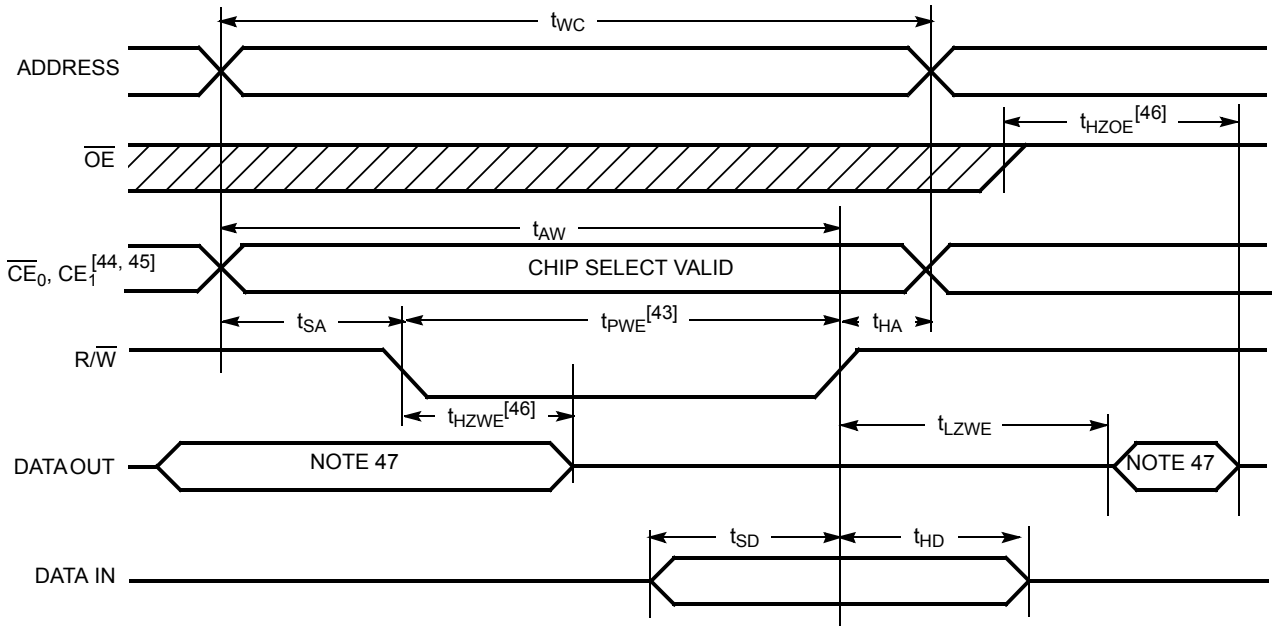

Figure 8. Write Cycle No. 2 (CE Controlled Timing) [40, 41, 42, 48]

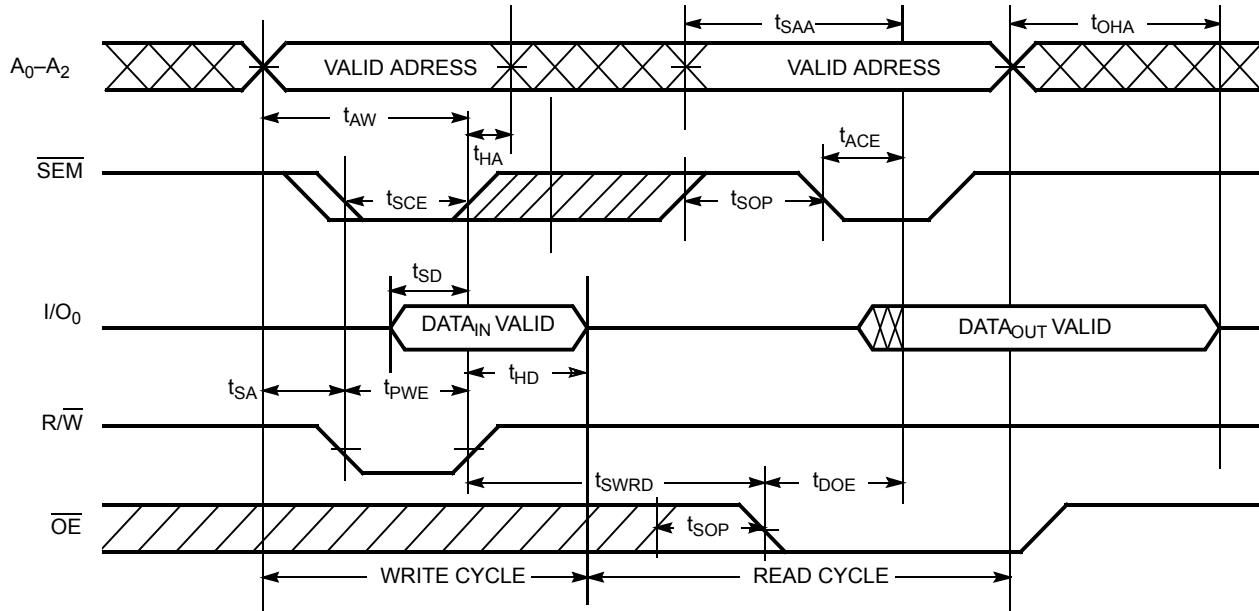

Notes

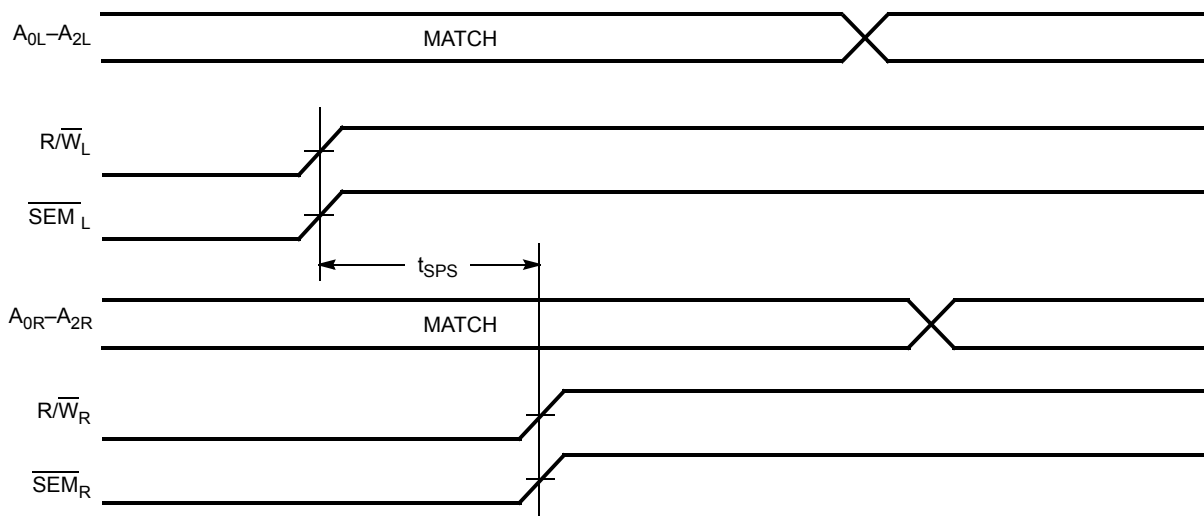

40. R/W must be HIGH during all address transitions.
41. A write occurs during the overlap ( $t_{SCE}$  or  $t_{PWE}$ ) of  $\overline{CE}_0=V_{IL}$  and  $CE_1=V_{IH}$  or  $\overline{SEM}=V_{IL}$  and  $\overline{B}_{0-3}$  LOW.
42.  $t_{HA}$  is measured from the earlier of  $\overline{CE}_0/CE_1$  or R/W or ( $\overline{SEM}$  or R/W) going HIGH at the end of Write Cycle.
43. If  $\overline{OE}$  is LOW during a R/W controlled write cycle, the write pulse width must be the larger of  $t_{PWE}$  or ( $t_{HZWE} + t_{SD}$ ) to allow the I/O drivers to turn off and data to be placed on the bus for the required  $t_{SD}$ . If  $\overline{OE}$  is HIGH during an R/W controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified  $t_{PWE}$ .
44. To access RAM,  $\overline{CE}_0 = V_{IL}$ ,  $CE_1 = \overline{SEM} = V_{IH}$ .
45. To access byte  $\overline{B}_0$ ,  $\overline{CE}_0 = V_{IL}$ ,  $\overline{B}_0 = V_{IL}$ ,  $CE_1 = \overline{SEM} = V_{IH}$ .  
To access byte  $\overline{B}_1$ ,  $\overline{CE}_0 = V_{IL}$ ,  $\overline{B}_1 = V_{IL}$ ,  $CE_1 = \overline{SEM} = V_{IH}$ .  
To access byte  $\overline{B}_2$ ,  $\overline{CE}_0 = V_{IL}$ ,  $\overline{B}_2 = V_{IL}$ ,  $CE_1 = \overline{SEM} = V_{IH}$ .  
To access byte  $\overline{B}_3$ ,  $\overline{CE}_0 = V_{IL}$ ,  $\overline{B}_3 = V_{IL}$ ,  $CE_1 = \overline{SEM} = V_{IH}$ .
46. Transition is measured  $\pm 150$  mV from steady state with a 5-pF load (including scope and jig). This parameter is sampled and not 100% tested.
47. During this period, the I/O pins are in the output state, and input signals must not be applied.
48. If the  $\overline{CE}_0$  LOW and  $CE_1$  HIGH or  $\overline{SEM}$  LOW transition occurs simultaneously with or after the R/W LOW transition, the outputs remain in the high-impedance state.

**Switching Waveforms (continued)**

**Figure 9. Semaphore Read After Write Timing, Either Side [49]**

**Figure 10. Timing Diagram of Semaphore Contention [50, 51, 52]**

**Notes**

49.  $\overline{CE}_0 = \text{HIGH}$  and  $\overline{CE}_1 = \text{LOW}$  for the duration of the above timing (both write and read cycle).

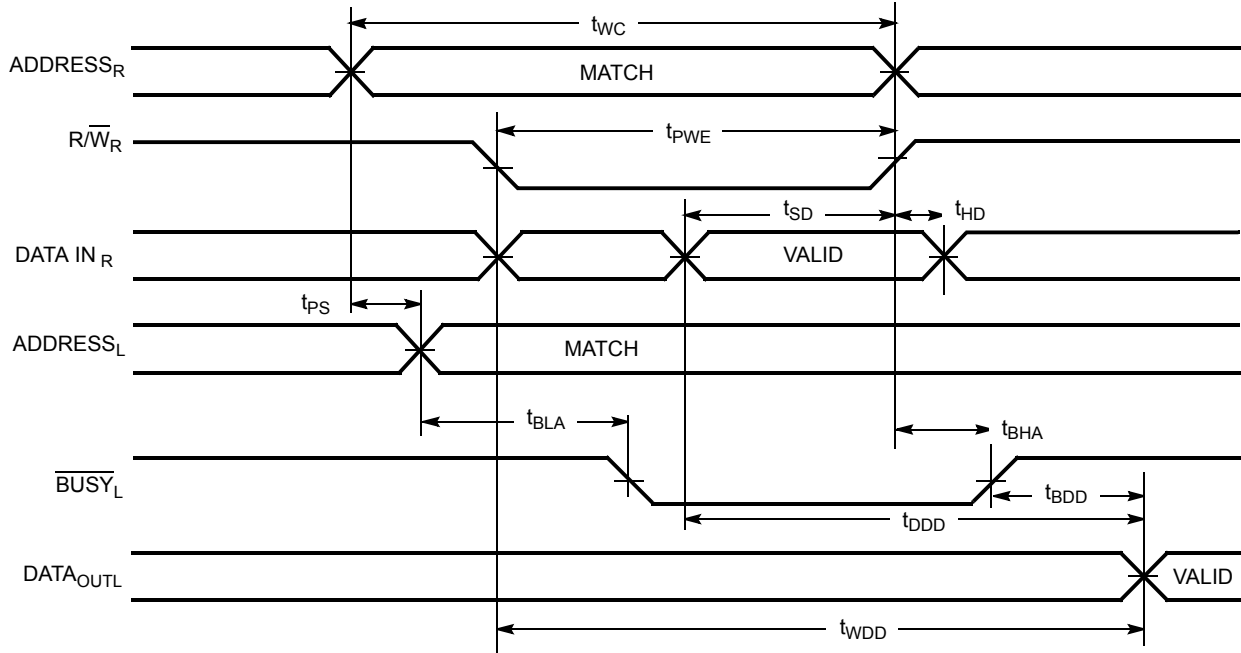

50.  $I/O_{0R} = I/O_{0L} = \text{LOW}$  (request semaphore);  $\overline{CE}_{0R} = \overline{CE}_{0L} = \text{HIGH}$  and  $\overline{CE}_{1R} = \overline{CE}_{1L} = \text{LOW}$ .

51. Semaphores are reset (available to both ports) at cycle start.

52. If  $t_{SPS}$  is violated, the semaphore will definitely be obtained by one side or the other, but which side will get the semaphore is unpredictable.

**Switching Waveforms (continued)**

**Figure 11. Timing Diagram of Write with  $\overline{\text{BUSY}}$  ( $\overline{\text{M/S}} = \text{HIGH}$ )** [53]

**Figure 12. Write Timing with Busy Input ( $\overline{\text{M/S}} = \text{LOW}$ )**

**Note**  
53.  $\overline{\text{CE}}_{0\text{L}} = \overline{\text{CE}}_{0\text{R}} = \text{LOW}$ ;  $\text{CE}_{1\text{L}} = \text{CE}_{1\text{R}} = \text{HIGH}$ .

Switching Waveforms (continued)

Figure 13. Busy Timing Diagram No. 1 ( $\overline{CE}$  Arbitration) [54]

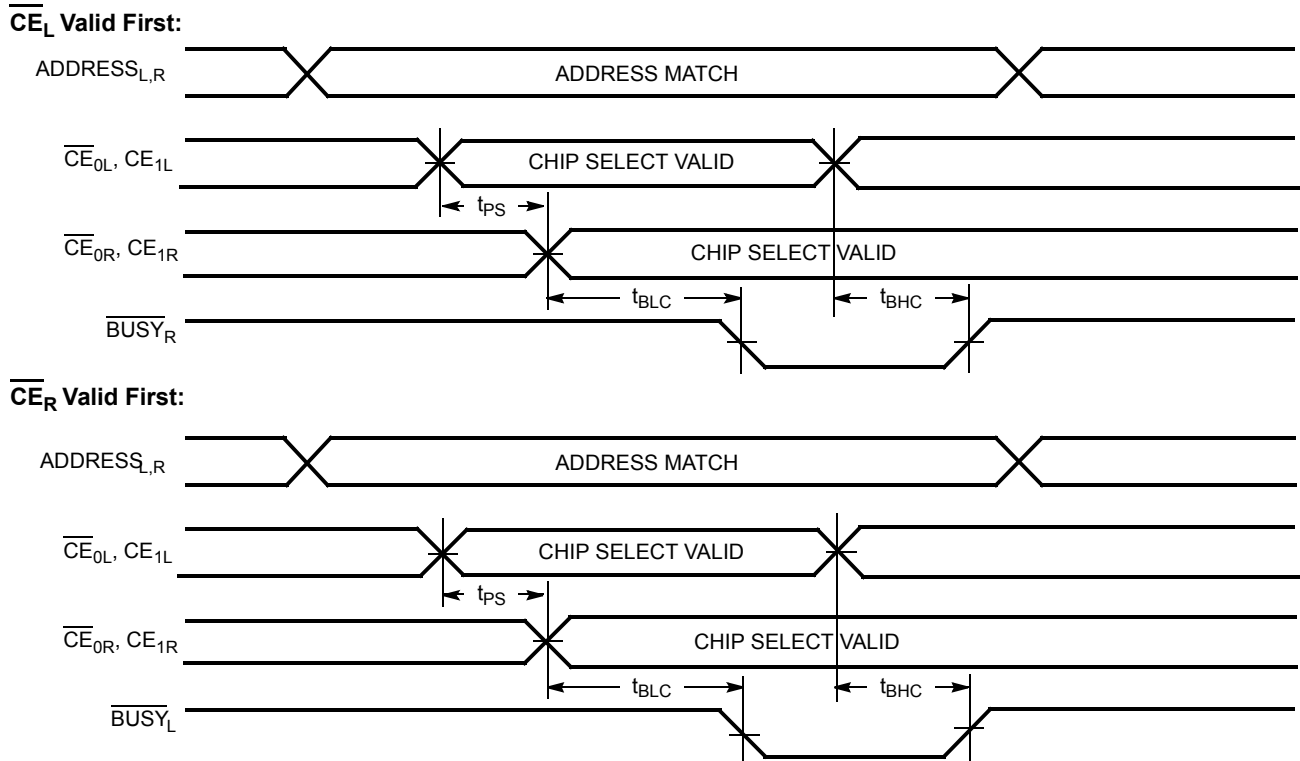

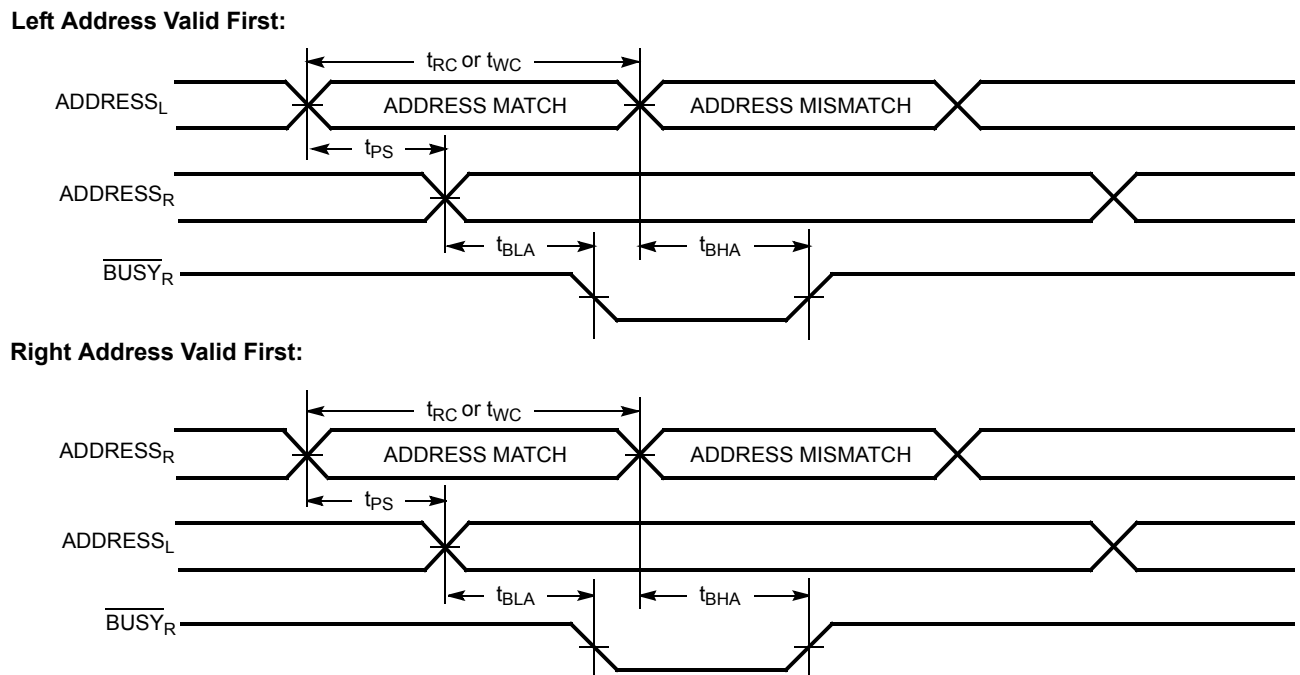

Figure 14. Busy Timing Diagram No. 2 (Address Arbitration) [54]

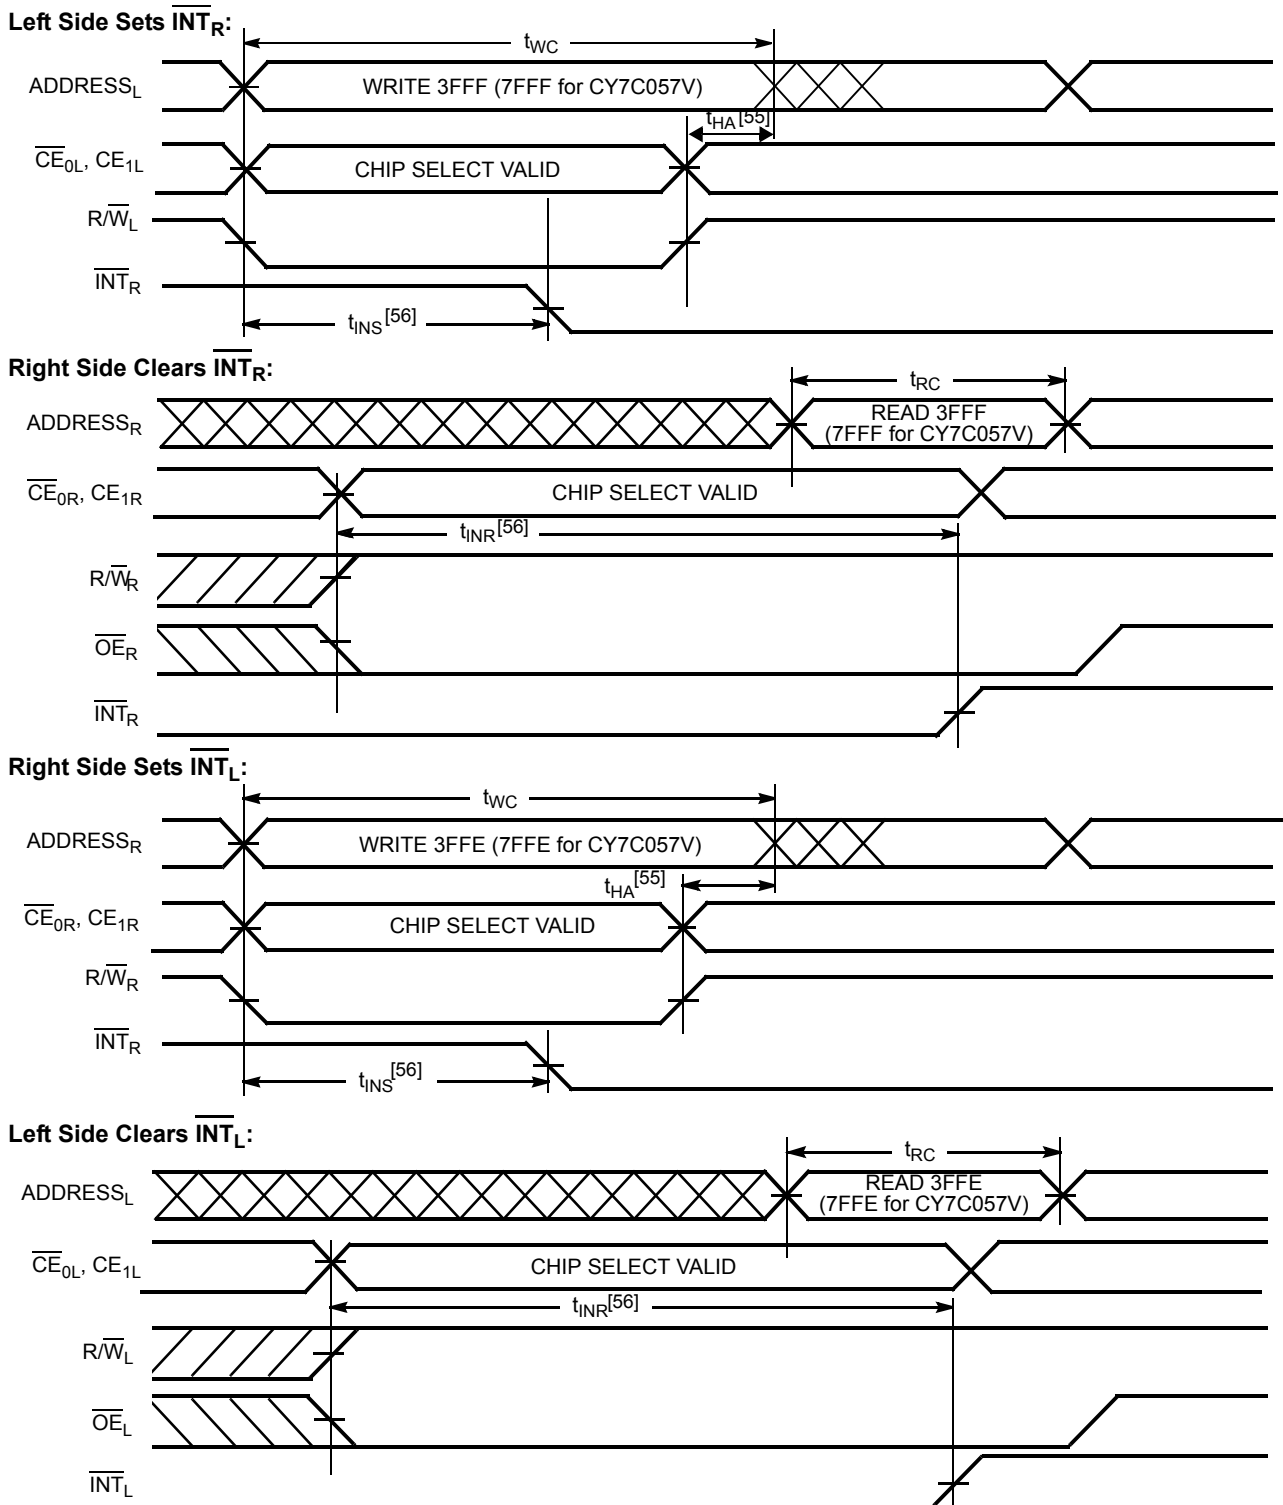

Note

54. If  $t_{PS}$  is violated, the busy signal will be asserted on one side or the other, but there is no guarantee to which side  $\overline{BUSY}$  will be asserted.

**Switching Waveforms (continued)**

**Figure 15. Interrupt Timing Diagrams**

**Notes**

- 55.  $t_{\text{HA}}$  depends on which enable pin ( $\overline{\text{CE}}_{0L}/\text{CE}_{1L}$  or R/ $\overline{\text{W}}_L$ ) is deasserted first.
- 56.  $t_{\text{INS}}$  or  $t_{\text{INR}}$  depends on which enable pin ( $\overline{\text{CE}}_{0L}/\text{CE}_{1L}$  or R/ $\overline{\text{W}}_L$ ) is asserted last.
