

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1.0 Features

The CY7C646xx (EZ-USB FX) is Cypress Semiconductor's second-generation full-speed USB family. *FX* products offer higher performance and a higher level of integration than first-generation EZ-USB products. The FX builds on the EZ-USB feature set, including an intelligent USB core, enhanced 8051, 8-Kbyte RAM, and high-performance I/O. The CY7C646xx enhances the EZ-USB family by providing faster operation and more ways to transfer data into and out of the chip at very high speed.

1.1 EZ-USB FX Features

- Single-chip integrated USB Transceiver, Serial Interface Engine (SIE), and Enhanced 8051 Microprocessor
- Soft: 8051 runs from internal RAM, which is:
 - Downloaded via USB, or
 - Loaded from EEPROM
- 14 Bulk/Interrupt endpoints, each with a maximum packet size of 64 bytes
- 16 Isochronous endpoints, with 2 KB of buffer space (1 KB, double buffered) which may be divided among the sixteen isochronous endpoints
- Integrated, industry standard 8051 with enhanced features:
 - Four clocks per cycle
 - Two UARTS
 - Three counter/timers
 - Expanded interrupt system
 - Two data pointers
- 3.3-volt operation
- Smart Serial Interface Engine (SIE)
- Vectored USB interrupts
- Separate buffers for the SETUP and DATA portions of a CONTROL transfer
- Integrated I²C™ controller
- 48-MHz or 24-MHz 8051 operation
- Enhanced IO
 - IO port registers mapped to SFRs
 - Port bits can be controlled using 8051 bit addressing instructions
- Four integrated general purpose 8-bit FIFOs
 - 64 bytes each
 - Automatic conversion to and from 16-bit buses

- FIFOs can use externally supplied clock
- Easy interface to ASIC and DSP ICs
- Brings glue FIFOs inside for lower system cost
- DMA Controller
 - Moves data between slave FIFOs, memory, and ports
 - Very fast transfers—one clock (20.8 ns) per byte for internal transfers
 - Can use external RAM as additional FIFO (addressed through A/D buses)
- Special Autovectors for DMA and FIFO interrupts
- 400-kHz or 100-kHz I²C operation
- General Programmable Interface (GPIF)
 - Allows direct connection to most parallel interfaces: 8- and 16-bit
 - Programmable Waveform Descriptors and Configuration Registers to define waveforms
 - Supports multiple Ready (RDY) inputs and Control (CTL) outputs
- Three package options - 128-pin PQFP, 80-pin PQFP, and 52-pin PQFP

1.2 Example Applications

- DSL modems
- ATAPI interface
- Memory card readers
- Legacy conversion devices
- Cameras
- Scanners
- Home PNA
- Wireless LAN
- MP3 players
- Networking

2.0 Functional Overview

The CY7C646xx enhances the line of Cypress EZ-USB chips while maintaining code compatibility. The CY7C646xx builds on the feature set that has already made the EZ-USB family a popular choice for high-integration, high-speed USB applications:

- **Soft operation.** Program code can be downloaded into on-chip RAM via the USB cable, eliminating the need for external program memory or mask ROM headaches.
- **Enhanced 8051.** A speedy four clocks per cycle, plus expanded features.
- **Smart SIE.** The USB Serial Interface Engine does much of the low-level USB overhead in logic, simplifying the 8051 code.
- **DMA for very fast 8-bit or 16-bit transfers.** In the fastest (synchronous byte) mode, one byte can be transferred per 48-MHz clock, or every 20.8 nanoseconds.
- **General Programmable Interface (GPIF).** A reconfigurable 8- or 16-bit parallel interface allows the CY7C646xx to perform local bus mastering, and can implement a wide variety of protocols such as ATAPI, printer parallel port, and Utopia.
- **Abundant endpoints and buffers.** 16x64 byte buffers for bulk/interrupt/control endpoints, 2x1024 byte FIFOs for up to 16 isochronous endpoints.
- **Glueless memory expansion.** The 8051 16-bit address bus and 8-bit data bus is available, along with strobes RD#, WR#, OE# and CS#. The buses are brought out on separate pins (not multiplexed, as in the standard 8051), saving one clock per external memory cycle.
- **48-MHz or 24-MHz 8051 selectable by EEPROM configuration byte.**
- **Five 8-bit IO ports.**
- **Optimum 8051 IO efficiency.** IO pins can be addressed as external registers (as in EZ-USB) or through 8051 SFR (Special Function Register) bits for faster operation.
- **Four internal FIFOs for glueless interface to ASICs, DSPs, or external logic.** These FIFOs can be clocked either by an internal or external clock, and can operate either synchronously (using strobes and a clock) or asynchronously (using strobes only). The FIFOs have 8-16 and 16-8 bit conversion modes that simplify interface to external data buses.
- **The vectored interrupt system is expanded to accommodate the FIFO flags and DMA systems.** Also, the 8051 can clear the USB (INT2) or the FIFO/DMA (INT4) interrupt request bit for the interrupt currently being serviced by writing an SFR location, saving time and code in the interrupt service routine.
- **400-kHz or 100-kHz I²C bus controller speed.**

2.1 Microprocessor

The CY7C646xx uses a 12-MHz crystal for low EMI. An internal oscillator and PLL develops an internal 48-MHz clock for use by the USB Serial Interface Engine and the 8051 microprocessor. The 8051 can run at either 24 MHz or 48 MHz, controlled by a byte in the EEPROM attached to the I²C bus. The default rate (with no EEPROM connected) is 24 MHz.

The internal microprocessor is an enhanced version of the industry-standard 8051. Enhancements include 4 clock per cycle operation, a second data pointer, and an enhanced interrupt system. The 8051 includes two UARTS, three counter-timers, and 256 bytes of register RAM.

The EZ-USB family implements IO differently than the standard 8051, by having its IO control registers in external memory space. The CY7C646xx preserves this addressing for backward EZ-USB compatibility, and adds the ability to control IO registers using 8051 SFRs (Special Function Registers). This improves IO access time. For example, an IO pin may be toggled using one 8051 instruction, e.g., CPL (bit).

The 8051 program and data memory consists of an internal 8 KB RAM. This RAM is normally downloaded via the USB cable at plug-in, followed by the 8051 starting up and executing the downloaded code. This gives the CY7C646xx family its 'soft' operation feature, whereby permanent memory such as ROM or Flash memory is not required. Program code updates can easily be done in the field since the code is loaded from the PC, not by physically changing or reprogramming a memory device. The 8051 program memory can also be loaded from the EEPROM connected to the I²C bus on reset for stand-alone use without the USB connected.

The 128-pin version of the CY7C646xx brings out the full 8051 address and data buses, plus decoded control signals OE#, CS#, RD#, PSEN, and WR# to allow glueless connection to external memory devices. The 80- and 52-pin packages allow smaller footprints and more effective solutions for certain designs, but do not have external access to the 8051 buses.

2.2 USB SIE

The CY7C646xx uses the EZ-USB family enhanced SIE (Serial Interface Engine). This SIE has the intelligence to perform full USB enumeration, creating a default USB device with predefined endpoints and alternate settings. This enhanced SIE is essential in achieving the family's soft operation, since it provides the mechanism to download firmware prior to the 8051 running.

Once the 8051 is in control, it can use advanced features of the SIE to simplify its USB firmware. Endpoint zero SETUP data is placed in a separate 8-byte RAM space for easy access. GET_Descriptor requests are simplified by using a special Setup Data Pointer. The 8051 simply loads a descriptor address into this 16-bit register, and the SIE takes care of the remaining overhead, i.e., dividing the descriptor into packets, sending them via endpoint 0 in response to IN tokens, and providing the necessary handshakes. The 8051 can do other chores while the SIE completes this USB transfer.

2.3 Endpoints

Endpoint	Type	Buffer Size
EP0-IN	Control	64
EP0-OUT		64
EP1-IN	Bulk/Interrupt	64
EP1-OUT	Bulk/Interrupt	64
EP2-IN	Bulk/Interrupt	64
EP2-OUT	Bulk/Interrupt	64
EP3-IN	Bulk/Interrupt	64
EP3-OUT	Bulk/Interrupt	64
EP4-IN	Bulk/Interrupt	64
EP4-OUT	Bulk/Interrupt	64
EP5-IN	Bulk/Interrupt	64
EP5-OUT	Bulk/Interrupt	64
EP6-IN	Bulk/Interrupt	64
EP6-OUT	Bulk/Interrupt	64
EP7-IN	Bulk/Interrupt	64
EP7-OUT	Bulk/Interrupt	64
EP8-IN	Isochronous	0–1023 ^[1]
EP8-OUT	Isochronous	0–1023 ^[1]
EP9-IN	Isochronous	0–1023 ^[1]
EP9-OUT	Isochronous	0–1023 ^[1]
EP10-IN	Isochronous	0–1023 ^[1]
EP10-OUT	Isochronous	0–1023 ^[1]
EP11-IN	Isochronous	0–1023 ^[1]
EP11-OUT	Isochronous	0–1023 ^[1]
EP12-IN	Isochronous	0–1023 ^[1]
EP12-OUT	Isochronous	0–1023 ^[1]
EP13-IN	Isochronous	0–1023 ^[1]
EP13-OUT	Isochronous	0–1023 ^[1]
EP14-IN	Isochronous	0–1023 ^[1]
EP14-OUT	Isochronous	0–1023 ^[1]
EP15-IN	Isochronous	0–1023 ^[1]
EP15-OUT	Isochronous	0–1023 ^[1]

Note:

1. 1023 FIFO bytes may be divided among all Isochronous endpoints.

The CY7C646xx has Control, Bulk, and Interrupt endpoints which each have 64-byte buffers to accommodate the maximum USB specified packet size, giving the highest USB throughput. One endpoint pair is dedicated to endpoint zero, with separate EP0-IN and EP0-OUT buffers to simplify programming. Fourteen additional 64-byte buffers may be used as Bulk or Interrupt endpoints. These endpoints may also be double-buffered by using an endpoint pairing mechanism. Double buffering allows the 8051 to access a packet as another is being transmitted or received over USB. This technique is essential in high-bandwidth applications where NAKs by the USB function would reduce performance.

The CY7C646xx also has sixteen Isochronous (ISO) endpoints which share 1024 bytes of double-buffered endpoint memory (2 KB total). The ISO buffer sizes are programmable within 16-byte increments. The Isochronous endpoint buffers are accessed as FIFOs.

Endpoint data is serviced either directly by the 8051, or moved on or off-chip using the DMA system built into the CY7C646xx. Bulk data is available in 64-byte random-access buffers that can also be addressed as a FIFO using the special AutoPointer feature. Each endpoint has a unique interrupt vector. This allows ISRs (Interrupt Service Routines) automatically to be called with minimum overhead and latency, simply by including the ISR address in an interrupt jump table.

2.4 Default USB Machine

When the CY7C64613 is plugged into USB with no EEPROM attached to its I²C port (but **with** the SCL and SDA pull-ups installed), the intelligent SIE enumerates as a generic USB device with the following characteristics:

ID bytes (hex)

VID (Vendor ID)	0547
PID (Product ID)	2235
DID (Device ID)	0000

Default Endpoints

Endpoint	Type	Alternate Setting		
		0	1	2
Max Packet Size (bytes)				
0	CTL	64	64	64
1 IN	INT	0	16	64
2 IN	BULK	0	64	64
2 OUT	BULK	0	64	64
4 IN	BULK	0	64	64
4 OUT	BULK	0	64	64
6 IN	BULK	0	64	64
6 OUT	BULK	0	64	64
8 IN	ISO	0	16	256
8 OUT	ISO	0	16	256
9 IN	ISO	0	16	16
9 OUT	ISO	0	16	16
10 IN	ISO	0	16	16
10 OUT	ISO	0	16	16

Powering up with default USB characteristics allows code to be written without initial consideration of the enumeration code that establishes the default USB device, speeding the learning process.

2.5 IBN (In-Bulk-NAK) Interrupts

The CY7C646xx has an interrupt that indicates that an IN token has been received by an endpoint, and the SIE has NAK'd the transfer due to no data being available in the endpoint buffer. Interrupt request bits are provided for endpoints EP1IN through EP7IN, and a previously reserved vector is added to the USB vectored interrupts.

2.6 Slave FIFOs

Many high-bandwidth USB designs use a FIFO between the USB interface chip and external logic to match data rates, or to smooth the USB data delivery (which, being packet oriented, occurs in bursts). The CY7C646xx moves this glue logic into the part by providing four 64-byte internal slave FIFOs. The FIFOs also provide two important interface functions, external clocking and bus width conversion.

Using external clocking, external logic (such as a DSP or ASIC) can clock data into or out of the slave FIFOs under control of its own clock, rather than synchronizing with the clock supplied by the CY7C646xx (24 or 48 MHz). The FIFOs can be controlled

either synchronously (using strobe signals and a clock) or asynchronously (using strobe signals only). The slave FIFO data is available as two 8-bit buses, which may be used simultaneously to operate as a single 16-bit data bus. The 16-bit connection, along with fast double-byte mode, combine to give fast conversion between 8 and 16 bit buses. A flexible set of FIFO flags (full, empty, and programmable) provide FIFO flow control.

2.7 DMA

With many sources and destinations for USB data, such as endpoint buffers, slave FIFOs, and internal/external RAM buffers, it is important to move blocks of data between them quickly. Using internal DMA, the 8051 sets up source, destination, and transfer length registers, and then initiates a DMA transfer. The maximum DMA transfer rate occurs between internal resources, such as endpoint buffers and slave FIFOs. This maximum rate is one byte per 48-MHz clock, or 48 Mbytes per second.

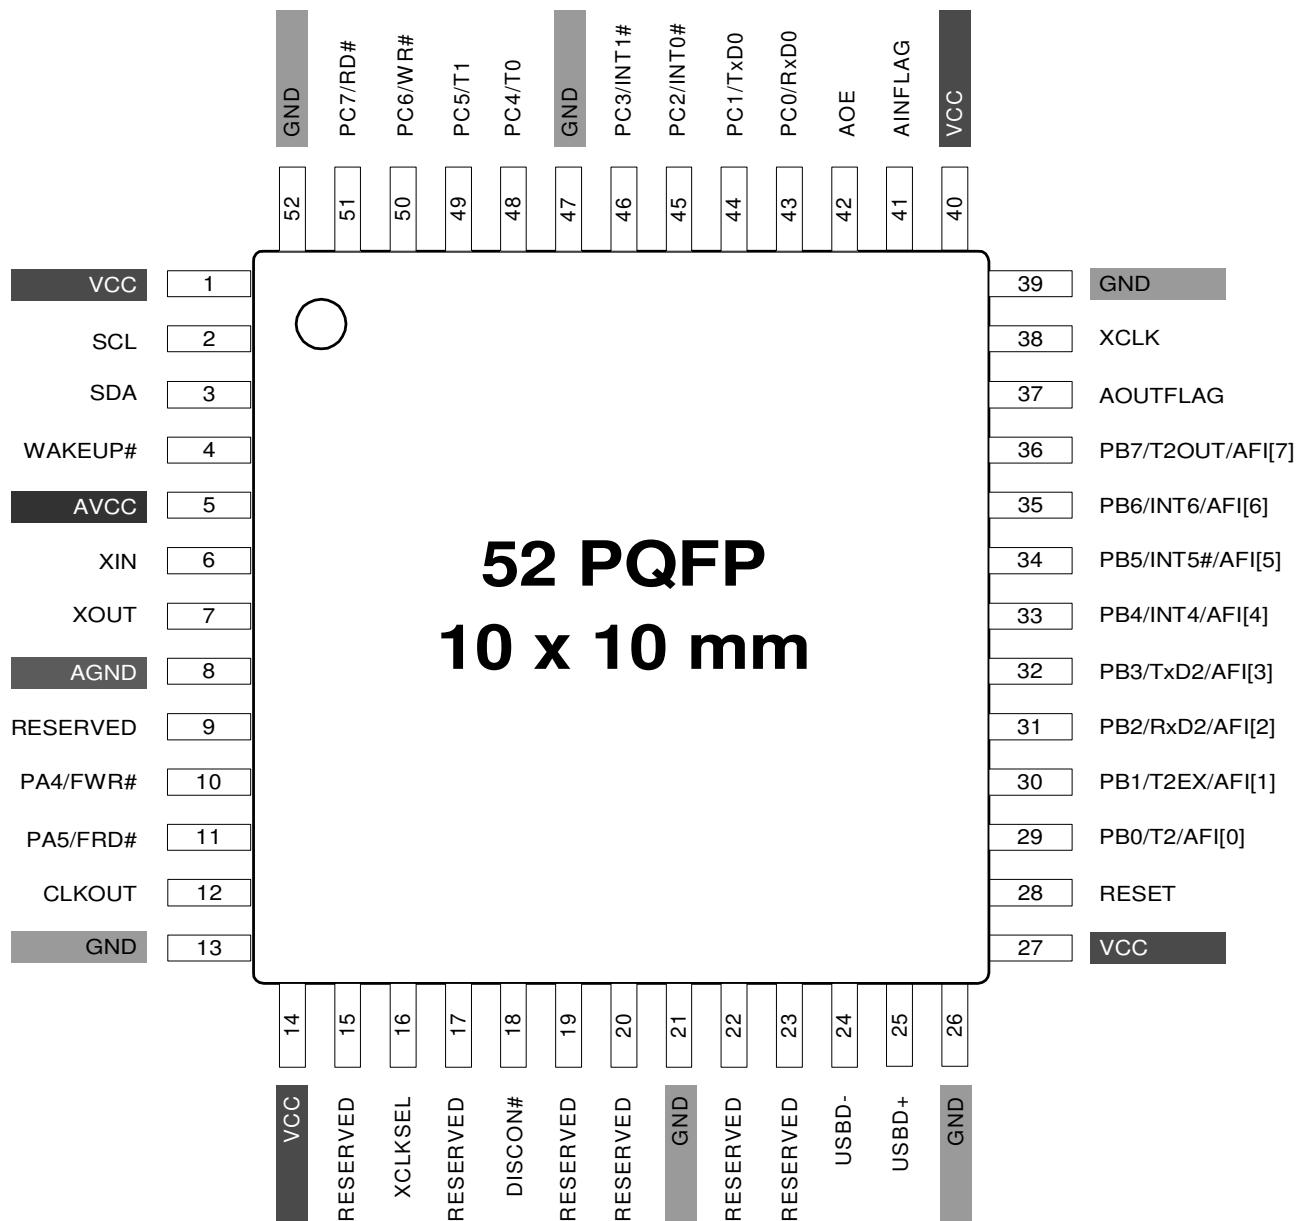

2.8 GPIF (General Programmable Interface)

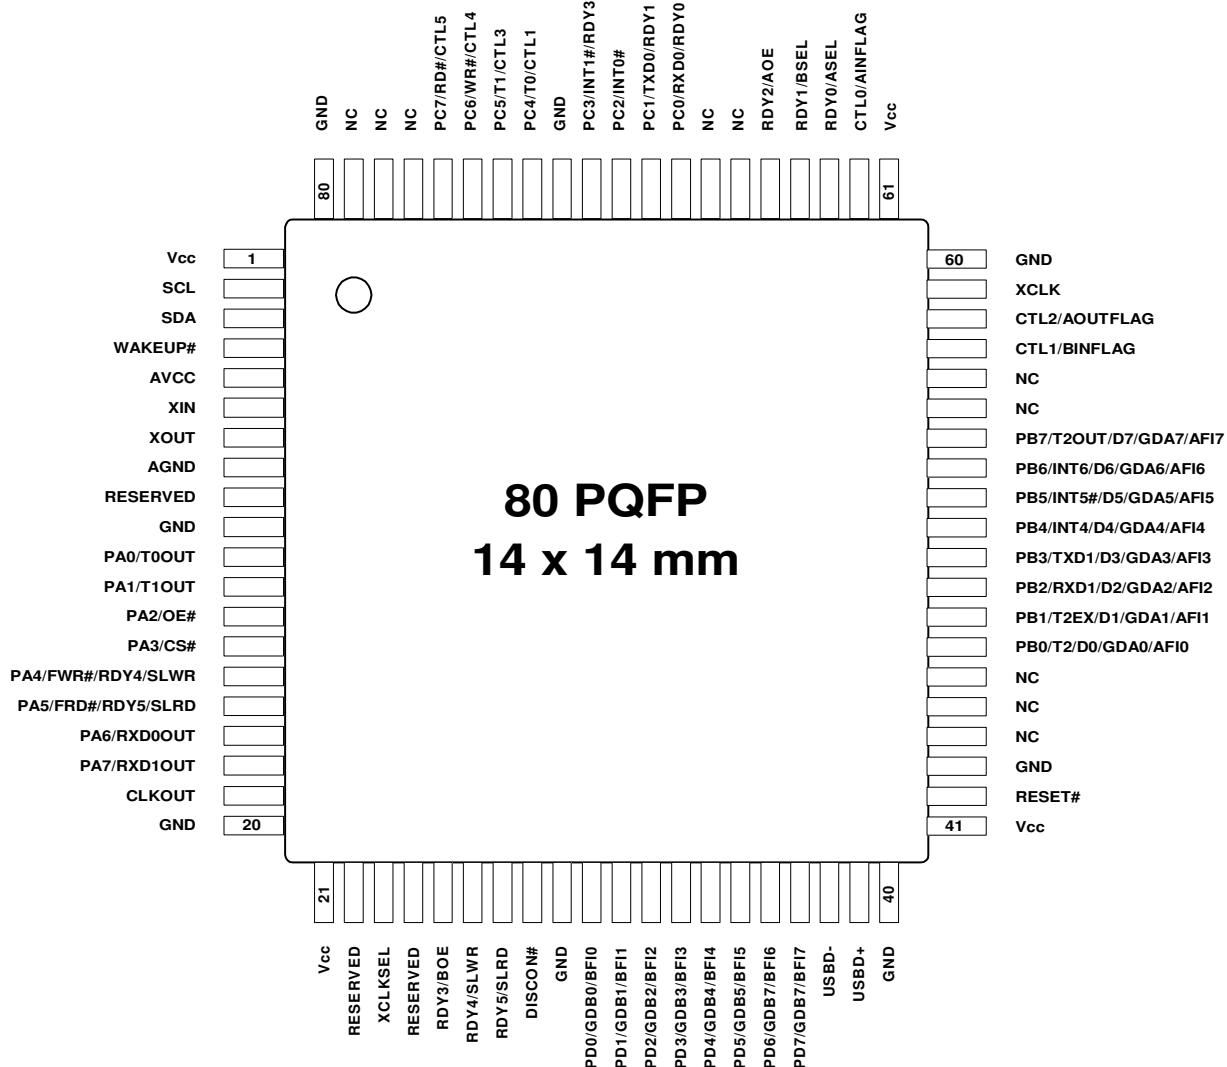

The GPIF is a flexible 8 or 16-bit parallel interface driven by a user-programmable set of vectors that operate similarly to a finite state machine. It allows the CY7C646xx to perform local bus mastering, and can implement a wide variety of protocols such as ATAPI, printer parallel port, and Utopia.

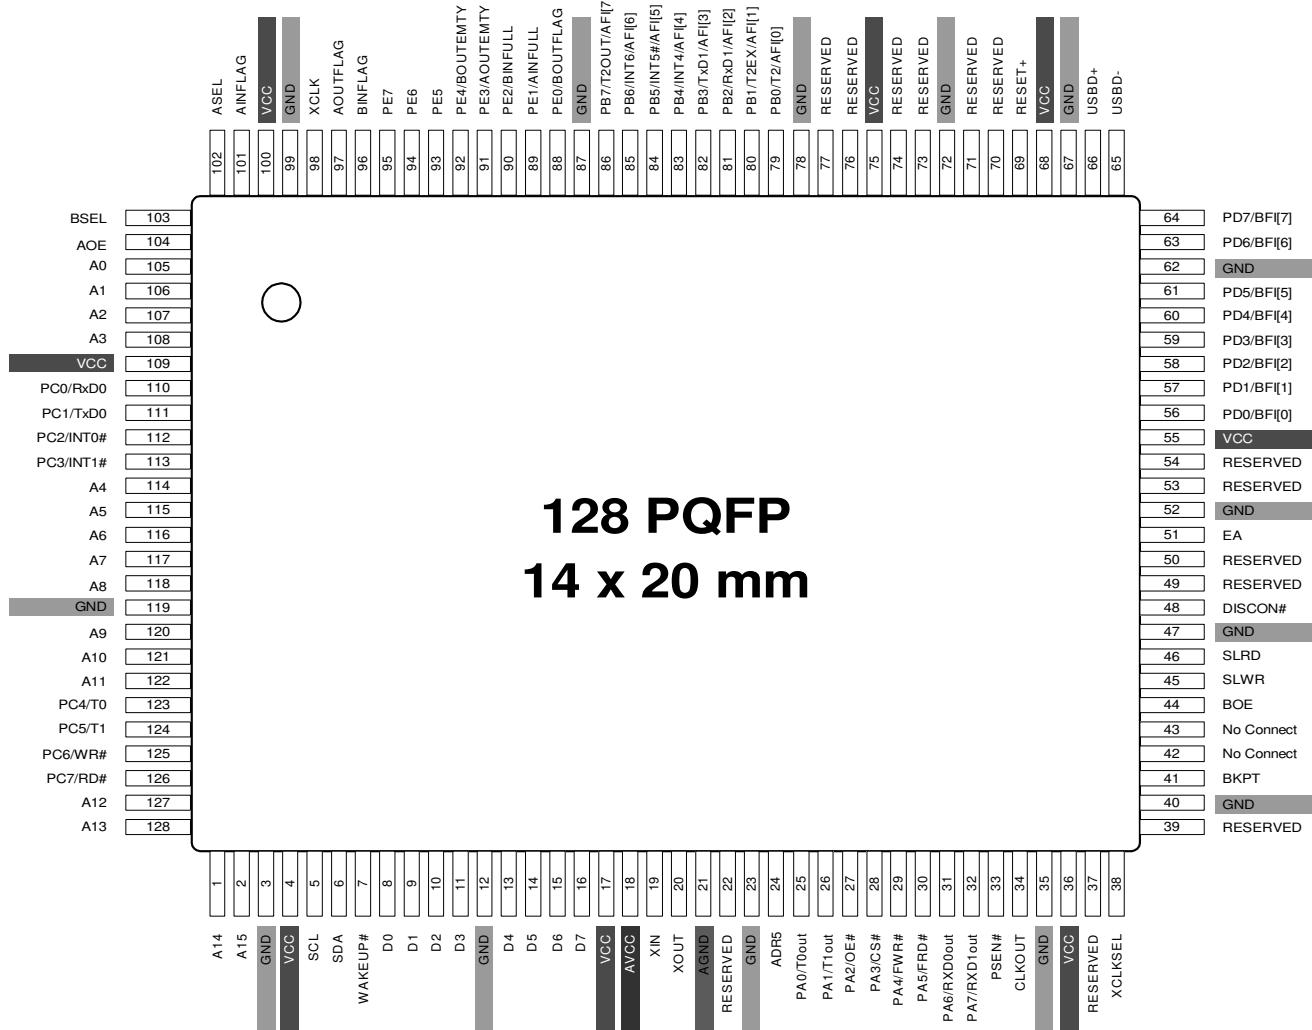

The GPIF has six programmable Control Outputs (CTL), six Address Outputs (ADR), and six general purpose Ready Inputs (RDY). The data bus width can be 8 or 16 bits. Each GPIF vector defines the state of the control outputs, or determines what state a ready input (or multiple inputs) must be before proceeding. A sequence of the GPIF vectors make up a single waveform that will be executed to perform the desired data move between the CY7C646xx and the external design.

3.0 Pin Assignments

3.1 Pin Diagrams

3.2 CY7C646xx Pin Descriptions

128	80	52	Name	Type	Default	Description
18	5	5	AVCC	Power	N/A	Analog V_{cc}. This signal provides power to the analog section of the chip.
21	8	8	AGND	Power	N/A	Analog Ground. Connect to ground with as short a path as possible.
48	28	18	DISCON#	O/Z	H	Disconnect. This pin can drive HIGH, LOW, or float. DISCON# pin floats when the register bit USBCS.2 is LOW, and drives when it is HIGH. The drive level of the DISCON# pin is the invert of register bit USBCS.3. The DISCON# pin is normally connected to the USB D+ line through a 1500Ω resistor. The CY7C646xx signals a USB connection by setting USBCS.3=0 (drive 3.3V) and USBCS.2=1 (output enable). The CY7C646xx signals a USB disconnect by setting USBCS.2=0 which floats the pin and disconnects the 1500Ω resistor from D+.

3.2 CY7C646xx Pin Descriptions (continued)

128	80	52	Name	Type	Default	Description
65	38	24	USBD-	I/O/Z	Z	USB D- Signal. Connect to the USB D- signal through a 24Ω resistor.
66	39	25	USBD+	I/O/Z	Z	USB D+ Signal. Connect to the USB D+ pin through a 24Ω resistor.
105			A0	Output	L	8051 Address Bus. This bus is driven at all times. When the 8051 is addressing internal RAM it reflects the internal address. During DMA transfers that use the RD# and WR# strobes, the address bus contains the incrementing DMA source or destination address for data transferred over D[7..0].
106			A1	Output	L	
107			A2	Output	L	
108			A3	Output	L	
114			A4	Output	L	
115			A5	Output	L	
116			A6	Output	L	
117			A7	Output	L	
118			A8	Output	L	
120			A9	Output	L	
121			A10	Output	L	
122			A11	Output	L	
127			A12	Output	L	
128			A13	Output	L	
1			A14	Output	L	
2			A15	Output	L	
8			D0	I/O/Z	Z	8051 Data Bus. This bidirectional bus is high-impedance when inactive, input for bus reads, and output for bus writes. The data bus is used for external 8051 program and data memory. The data bus is also used for DMA transfers that use the RD#/FRD#, WR#, FWR# pins as strobes. The data bus is active only for external bus accesses, and is driven LOW in suspend.
9			D1	I/O/Z	Z	
10			D2	I/O/Z	Z	
11			D3	I/O/Z	Z	
13			D4	I/O/Z	Z	
14			D5	I/O/Z	Z	
15			D6	I/O/Z	Z	
16			D7	I/O/Z	Z	
33			PSEN#	Output	H	Program Store Enable. This active-LOW signal indicates an 8051 code fetch from external memory. It is active for program memory fetches from 0x1B40-0xFFFF when the EA pin is LOW, or from 0x0000-0xFFFF when the EA pin is HIGH.
41			BKPT	Output	L	Breakpoint. This pin goes active (HIGH) when the 8051 address bus matches the BPADDRH/L registers and breakpoints are enabled in the USBBAV register (BPEN=1). If the BPPULSE bit in the USBBAV register is HIGH, this signal pulses HIGH for eight 24-/48-MHz clocks. If the BPPULSE bit is LOW, the signal remains HIGH until the 8051 clears the BREAK bit (by writing 1 to it) in the USBBAV register.
69	42	28	RESET#	Input	N/A	Active LOW Reset. Resets the entire chip. This pin is normally tied to V _{CC} through a 10K resistor, and to GND through a 1-μF capacitor. Hysteresis input.
51			EA	Input	N/A	External Access. This pin determines where the 8051 fetches code between addresses 0x0000 and 0x1B3F. If EA=0 the 8051 fetches this code from its internal RAM. IF EA=1 the 8051 fetches this code from external memory.

3.2 CY7C646xx Pin Descriptions (continued)

128	80	52	Name	Type	Default	Description
19	6	6	XIN	Input	N/A	Crystal Input. Connect this signal to a 12-MHz series-resonant, fundamental mode crystal and 22–33 pF capacitor to GND. Also connect a 1-MΩ resistor between XIN and XOUT.
20	7	7	XOUT	Output	N/A	Crystal Output. Connect this signal to a 12-MHz series-resonant, fundamental mode crystal and 22–33 pF capacitor to GND. Also connect a 1-MΩ resistor between XIN and XOUT.
34	19	12	CLKOUT	O/Z	24 MHz	24- or 48-MHz clock, phase locked to the 12-MHz input clock. Output frequency is set by an external EEPROM bit (Config0.2). If no EEPROM is connected to the I ² C port (but the required pull-up resistors are present), the 8051 defaults to 24-MHz operation. The 8051 may three-state this output by setting CPUCS,1=1. The CLKOUT pin may be inverted by setting the boot EEPROM bit CONFIG0.1=1.

Port A

25	11		PA0 or T0OUT	I/O/Z	I (PA0)	Multiplexed pin whose function is selected by two bits: PORTACFG.0 and IFCONFIG.3. PA0 is a bidirectional IO port pin. T0OUT is an active-HIGH signal from 8051 Timer-counter0. T0OUT outputs a high level for one CLKOUT clock cycle when Timer0 overflows. If Timer0 is operated in mode 3 (two separate timer/counters), T0OUT is active when the low byte timer/counter overflows.
26	12		PA1 or T1OUT	I/O/Z	I (PA1)	Multiplexed pin whose function is selected by two bits: PORTACFG.1 and IFCONFIG.3. PA1 is a bidirectional IO port pin. T1OUT is an active-HIGH signal from 8051 Timer-counter1. T1OUT outputs a high level for one CLKOUT clock cycle when Timer1 overflows. If Timer1 is operated in mode 3 (two separate timer/counters), T1OUT is active when the low byte timer/counter overflows.
27	13		PA2 or OE# or	I/O/Z	I (PA2)	Multiplexed pin whose function is selected by two bits: PORTACFG.2 and IFCONFIG.3. PA2 is a bidirectional IO port pin. OE# is an active-LOW output enable for external memory. If the OE# pin is used, it should be externally pulled up to V _{CC} to ensure that the write strobe is inactive (high) at power-on.
28	14		PA3 or CS#	I/O/Z	I (PA3)	Multiplexed pin whose function is selected by the PORTACFG.3 bit. PA3 is a bidirectional I/O port pin. CS# is an active-LOW chip select for external memory. If the CS# pin is used, it should be externally pulled up to V _{CC} to ensure that the write strobe is inactive (HIGH) at power-on.
29	15	10	PA4 or FWR# or RDY4 or SLWR	I/O/Z	I (PA4)	Multiplexed pin whose function is selected by the following bits: PORTACFG.4, PORTACFG2.4, and IFCONFIG[1..0]. PA4 is a bidirectional I/O port pin. FWR# is the write strobe output for an external FIFO connected to the data bus D[7..0]. If the FWR# pin is used, it should be externally pulled up to V _{CC} to ensure that the write strobe is inactive at power-on. RDY4 is a GPIF input signal. SLWR is the write strobe input for the slave FIFOs connected to AFI[7..0] and/or BFI[7..0].

3.2 CY7C646xx Pin Descriptions (continued)

128	80	52	Name	Type	Default	Description
30	16	11	PA5 or FRD# or RDY5 or SLRD	I/O/Z	I (PA5)	Multiplexed pin whose function is selected by the following bits: PORTACFG.5, PORTACF2.5, and IFCONFIG[1..0]. PA5 is a bidirectional I/O port pin. FRD# is the write strobe output for an external FIFO connected to the data bus D[7..0]. If the FRD# pin is used, it should be externally pulled up to V _{CC} to ensure that the read strobe is inactive at power-on. RDY5 is a GPIF input signal. SLRD is the read strobe input for the slave FIFOs connected to AFI[7..0] and/or BFI[7..0].
31	17		PA6 or RXD0OUT	I/O/Z	I (PA6)	Multiplexed pin whose function is selected by the PORTACFG.6 bit. PA6 is a bidirectional I/O port pin. RXD0OUT is an active-HIGH signal from 8051 UART0. If RXD0OUT is selected and UART0 is in mode 0, this pin provides the output data for UART0 only when it is in sync mode. Otherwise it is a 1.
32	18		PA7 or RXD1OUT	I/O/Z	I (PA7)	Multiplexed pin whose function is selected by the PORTACFG.7 bit. PA7 is a bidirectional I/O port pin. RXD1OUT is an active-HIGH output from 8051 UART1. When RXD1OUT is selected and UART1 is in mode 0, this pin provides the output data for UART1 only when it is in sync mode. In modes 1, 2, and 3, this pin is HIGH.

Port B

						The following descriptions apply to the PORT B pins: D[7..0] is the 8051 data bus. This bus is optionally available on PORT B pins to provide access to the 8051 data bus in smaller EZ-USB II packages that do not bring out the 8051 address and data buses. GDA[7..0] is the GPIF A data bus. AFI[7..0] is the bidirectional A-FIFO data bus.
79	47	29	PB0 or T2 or D[0] or GDA[0] or AFI [0]	I/O/Z	I (PB0)	Multiplexed pin whose function is selected by the following bits: PORTBCFG.0 and IFCONFIG[1..0]. PB0 is a bidirectional I/O port pin. T2 is the active-HIGH T2 input signal to 8051 Timer2, which provides the input to Timer2 when C/T2=1. When C/T2=0, Timer2 does not use this pin. AFI [0] is the bidirectional A-FIFO data bus.
80	48	30	PB1 or T2EX or D[1] or GDA[1] or AFI [1]	I/O/Z	I (PB1)	Multiplexed pin whose function is selected by the following bits: PORTBCFG.1 and IFCONFIG[1..0]. PB1 is a bidirectional I/O port pin. T2EX is an active-HIGH input signal to the 8051 Timer2. T2EX reloads timer 2 on its falling edge. T2EX is active only if the EXEN2 bit is set in T2CON. AFI [1] is the bidirectional A-FIFO data bus.
81	49	31	PB2 or RXD1 or D[2] or GDA[2] or AFI [2]	I/O/Z	I (PB2)	Multiplexed pin whose function is selected by the following bits: PORTBCFG.2 and IFCONFIG[1..0]. PB2 is a bidirectional I/O port pin. RXD1 is an active-HIGH input signal for 8051 UART1, which provides data to the UART in all modes. AFI [2] is the bidirectional A-FIFO data bus.

3.2 CY7C646xx Pin Descriptions (continued)

128	80	52	Name	Type	Default	Description
82	50	32	PB3 or TXD1 or D[3] or GDA[3] or AFI [3]	I/O/Z	I (PB3)	Multiplexed pin whose function is selected by the following bits: PORTBCFG.3 and IFCONFIG[1..0]. PB3 is a bidirectional I/O port pin. TXD1 is an active-HIGH output pin from 8051 UART1, which provides the output clock in sync mode, and the output data in async mode. AFI [3] is the bidirectional A-FIFO data bus.
83	51	33	PB4 or INT4 or D[4] or GDA[4] or AFI [4]	I/O/Z	I (PB4)	Multiplexed pin whose function is selected by the following bits: PORTBCFG.4 and IFCONFIG[1..0]. PB4 is a bidirectional I/O port pin. INT4 is the 8051 INT4 interrupt request input signal. The INT4 pin is edge-sensitive, active HIGH. AFI [4] is the bidirectional A-FIFO data bus.
84	52	34	PB5 or INT5# or D[5] or GDA[5] or AFI [5]	I/O/Z	I (PB5)	Multiplexed pin whose function is selected by the following bits: PORTBCFG.5 and IFCONFIG[1..0]. PB5 is a bidirectional I/O port pin. INT5# is the 8051 INT5 interrupt request input signal. The INT5 pin is edge-sensitive, active LOW. AFI [5] is the bidirectional A-FIFO data bus.
85	53	35	PB6 or INT6 or D[6] or GDA[6] or AFI [6]	I/O/Z	I (PB6)	Multiplexed pin whose function is selected by the following bits: PORTBCFG.6 and IFCONFIG[1..0]. PB6 is a bidirectional I/O port pin. INT6 is the 8051 INT5 interrupt request input signal. The INT6 pin is edge-sensitive, active HIGH. AFI [6] is the bidirectional A-FIFO data bus.
86	54	36	PB7 or T2OUT or D[7] or GDA[7] or AFI [7]	I/O/Z	I (PB7)	Multiplexed pin whose function is selected by the following bits: PORTBCFG.7 and IFCONFIG[1..0]. PB7 is a bidirectional I/O port pin. T2OUT is the active-HIGH output signal from 8051 Timer2. T2OUT is active (HIGH) for one clock cycle when Timer/Counter 2 overflows. AFI [7] is the bidirectional A-FIFO data bus.

Port C

110	68	43	PC0 or RXD0 or RDY0	I/O/Z	I (PC0)	Multiplexed pin whose function is selected by the PORTCCFG.0 and PORTCGPIF.0 bits. PC0 is a bidirectional I/O port pin. RXD0 is the active-HIGH RXD0 input to 8051 UART0, which provides data to the UART in all modes. RDY0 is a GPIF input signal.
111	69	44	PC1 or TXD0 or RDY1	I/O/Z	I (PC1)	Multiplexed pin whose function is selected by the PORTCCFG.1 and PORTCGPIF.1 bits. PC1 is a bidirectional I/O port pin. TXD0 is the active-HIGH TXD0 output from 8051 UART0, which provides the output clock in sync mode, and the output data in async mode. RDY1 is a GPIF input signal.
112	70	45	PC2 or INT0#	I/O/Z	I (PC2)	Multiplexed pin whose function is selected by the PORTCCFG.2 bit. PC2 is a bidirectional I/O port pin. INT0# is the active-LOW 8051 INT0 interrupt input signal, which is either edge triggered (IT0 = 1) or level triggered (IT0 = 0).
113	71	46	PC3 or INT1# or RDY3	I/O/Z	I (PC3)	Multiplexed pin whose function is selected by the PORTCCFG.3 and PORTCGPIF.3 bits. PC3 is a bidirectional I/O port pin. INT1# is the active-LOW 8051 INT1 interrupt input signal, which is either edge triggered (IT1 = 1) or level triggered (IT1 = 0). RDY3 is a GPIF input signal.

3.2 CY7C646xx Pin Descriptions (continued)

128	80	52	Name	Type	Default	Description
123	73	48	PC4 or T0 or CTL1	I/O/Z	I (PC4)	Multiplexed pin whose function is selected by the PORTCCFG.4 and PORTCGPIF.4 bits. PC4 is a bidirectional I/O port pin. T0 is the active-HIGH T0 signal for 8051 Timer0, which provides the input to Timer0 when C/T0 is 1. When C/T0 is 0, Timer0 does not use this bit. CTL1 is a GPIF output signal.
124	74	49	PC5 or T1 or CTL3	I/O/Z	I (PC5)	Multiplexed pin whose function is selected by the PORTCCFG.5 and PORTCGPIF.5 bits. PC5 is a bidirectional I/O port pin. T1 is the active-HIGH T1 signal for 8051 Timer1, which provides the input to Timer1 when C/T1 is 1. When C/T1 is 0, Timer1 does not use this bit. CTL3 is a GPIF output signal.
125	75	50	PC6 or WR# or CTL4	I/O/Z	I (PC6)	Multiplexed pin whose function is selected by the PORTCCFG.6 and PORTCGPIF.6 bits. PC6 is a bidirectional I/O port pin. WR# is the active-LOW write strobe output for external memory. If the WR# signal is used, it should be externally pulled up to V _{CC} to ensure that the write strobe is inactive at power-on. CTL4 is a GPIF output signal.
126	76	51	PC7 or RD# or CTL5	I/O/Z	I (PC7)	Multiplexed pin whose function is selected by the PORTCCFG.7 and PORTCGPIF.7 bits. PC7 is a bidirectional I/O port pin. RD# is the active-LOW read strobe output for external memory. If the RD# signal is used, it should be externally pulled up to V _{CC} to ensure that the write strobe is inactive at power-on. CTL5 is a GPIF output signal.

Port D

						Port D is multiplexed between three sources: PD0–PD7 are bidirectional I/O port pins. GDB[7..0] is the GPIF B data bus. BFI[7..0] is the bidirectional B-FIFO data bus.
56	30		PD0 or GDB[0] or BFI [0]	I/O/Z	I (PD0)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. BFI [0] is the bidirectional B-FIFO data bus.
57	31		PD1 or GDB[1] or BFI [1]	I/O/Z	I (PD1)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. BFI [1] is the bidirectional B-FIFO data bus.
58	32		PD2 or GDB[2] or BFI [2]	I/O/Z	I (PD2)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. BFI [2] is the bidirectional B-FIFO data bus.
59	33		PD3 or GDB[3] or BFI [3]	I/O/Z	I (PD3)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. BFI [3] is the bidirectional B-FIFO data bus.
60	34		PD4 or GDB[4] or BFI [4]	I/O/Z	I (PD4)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. BFI [4] is the bidirectional B-FIFO data bus.
61	35		PD5 or GDB[5] or BFI [5]	I/O/Z	I (PD5)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. BFI [5] is the bidirectional B-FIFO data bus.
63	36		PD6 or GDB[6] or BFI [6]	I/O/Z	I (PD6)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. BFI [6] is the bidirectional B-FIFO data bus.

3.2 CY7C646xx Pin Descriptions (continued)

128	80	52	Name	Type	Default	Description
64	37		PD7 or GDB[7] or BFI [7]	I/O/Z	I (PD7)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. BFI [7] is the bidirectional B-FIFO data bus.
Port E						
88			PE0 or ADR0 or BOUTFLAG	I/O/Z	I (PE0)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. PE0 is a bidirectional I/O port pin. ADR0 is a GPIF address output pin. BOUTFLAG is the B-OUT FIFO flag output, which indicates a programmable level of FIFO fullness.
89			PE1 or ADR1 or AINFULL	I/O/Z	I (PE1)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. PE1 is a bidirectional I/O port pin. ADR1 is a GPIF address output pin. AINFULL is the A-IN FIFO flag output, which indicates FIFO full.
90			PE2 or ADR2 or BINFULL	I/O/Z	I (PE2)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. PE2 is a bidirectional I/O port pin. ADR2 is a GPIF address output pin. BINFULL is the B-IN FIFO flag output, which indicates FIFO full.
91			PE3 or ADR3 or AOUTEMPTY	I/O/Z	I (PE3)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. PE3 is a bidirectional I/O port pin. ADR3 is a GPIF address output pin. AOUTEMPTY is the A-OUT FIFO flag output, which indicates FIFO empty.
92			PE4 or ADR4 or BOUTEMPTY	I/O/Z	I (PE4)	Multiplexed pin whose function is selected by the IFCONFIG[2..0] bits. PE4 is a bidirectional I/O port pin. ADR4 is a GPIF address output pin. BOUTEMPTY is the B-OUT FIFO flag output, which indicates FIFO empty.
93			PE5 or CTL3	I/O/Z	I (PE5)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. PE5 is a bidirectional I/O port pin. CTL3 is a GPIF output signal.
94			PE6 or CTL4	I/O/Z	I (PE6)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. PE6 is a bidirectional I/O port pin. CTL4 is a GPIF output signal.
95			PE7 or CTL5	I/O/Z	I (PE7)	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. PE7 is a bidirectional I/O port pin. CTL5 is a GPIF output signal.
24			ADR5	O	X	ADR5 is a GPIF address output pin.
102	63		RDY0 or ASEL	Input	X	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. RDY0 is a GPIF input signal. ASEL is the select input for the A-IN and A-OUT FIFOs.
103	64		RDY1 or BSEL	Input	X	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. RDY1 is a GPIF input signal. BSEL is the select input for the B-IN and B-OUT FIFOs.

3.2 CY7C646xx Pin Descriptions (continued)

128	80	52	Name	Type	Default	Description
104	65	42	RDY2 or AOE	Input		Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. RDY2 is a GPIF input signal. AOE is the output enable input for the A-OUT FIFO.
44	25		RDY3 or BOE	Input	X	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. RDY3 is a GPIF input signal. BOE is the output enable input for the B-OUT FIFO.
45	26		RDY4 or SLWR	Input	X	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. RDY4 is a GPIF input signal. SLWR is the input-only write strobe for the slave FIFOs connected to AFI[7..0] and/or BFI[7..0].
46	27		RDY5 or SLRD	Input	X	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. RDY5 is a GPIF input signal. SLRD is the input-only read strobe for the slave FIFOs connected to AFI[7..0] and/or BFI[7..0].
101	62	41	CTL0 or AINFLAG	Output	X	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. CTL0 is a GPIF control output. AINFLAG is the A-IN FIFO flag output which indicates a programmable level of FIFO fullness.
96	57		CTL1 or BINFLAG	Output	X	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. CTL1 is a GPIF control output. BINFLAG is the B-IN FIFO flag output which indicates a programmable level of FIFO fullness.
97	58	37	CTL2 or AOUTFLAG	Output	X	Multiplexed pin whose function is selected by the following bits: IFCONFIG[1..0]. CTL2 is a GPIF control output. AOUTFLAG is the A-OUT FIFO flag output which indicates a programmable level of FIFO fullness.
98	59	38	XCLK	Input	N/A	External clock input, used for synchronously clocking data into the slave FIFOs. XCLK also serves as a timing reference for all slave FIFO control signals and GPIF.
53		22	Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
54		23	Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
70			Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
71			Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
73			Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
74			Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
76			Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
77			Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
50		20	Reserved	Rsrvd	N/A	Reserved. Leave open.
49		19	Reserved	Rsrvd	N/A	Reserved. Connect to Ground.
7	4	4	WAKEUP#	Input	N/A	USB Wakeup. If the 8051 is in suspend, a HIGH-to-LOW edge on this pin starts up the oscillator and interrupts the 8051 to allow it to exit the suspend mode. Holding WAKEUP# LOW inhibits the EZ-USB chip from suspending.
5	2	2	SCL	OD	Z	I²C Clock. Connect to V _{CC} with a 1K resistor, even if no I²C peripheral is attached.

3.2 CY7C646xx Pin Descriptions (continued)

128	80	52	Name	Type	Default	Description
6	3	3	SDA	OD	Z	I²C Data. Connect to V _{CC} with a 1K resistor, even if no I²C peripheral is attached.
38	23	16	XCLKSEL	Input	N/A	HIGH: Use XCLK pin for GPIF and slave FIFOs. LOW: Use internal 48-MHz clock for GPIF and slave FIFOs.
39	24	17	Reserved	Rsvd	N/A	Reserved. Connect to Ground.
37	22	15	Reserved	Rsvd	N/A	Reserved. Connect to Ground.
22	9	9	Reserved	Rsvd	N/A	Reserved. Connect to Ground.
4	1	1	V _{CC}	Power	N/A	V _{CC} . Connect to 3.3 V power source.
17			V _{CC}	Power	N/A	V _{CC} . Connect to 3.3 V power source.
36	21	14	V _{CC}	Power	N/A	V _{CC} . Connect to 3.3 V power source.
55			V _{CC}	Power	N/A	V _{CC} . Connect to 3.3 V power source.
68	41	27	V _{CC}	Power	N/A	V _{CC} . Connect to 3.3 V power source.
75			V _{CC}	Power	N/A	V _{CC} . Connect to 3.3 V power source.
100	61	40	V _{CC}	Power	N/A	V _{CC} . Connect to 3.3 V power source.
109			V _{CC}	Power	N/A	V _{CC} . Connect to 3.3 V power source.
3	80	52	GND	Ground	N/A	Ground.
12			GND	Ground	N/A	Ground.
23	10		GND	Ground	N/A	Ground.
35	20	13	GND	Ground	N/A	Ground.
