Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

PSoC® 4: PSoC 4200-L Family Datasheet

Programmable System-on-Chip (PSoC®)

General Description

PSoC® 4 is a scalable and reconfigurable platform architecture for a family of programmable embedded system controllers with an ARM® Cortex®-M0 CPU. It combines programmable and reconfigurable analog and digital blocks with flexible automatic routing. The PSoC 4200-L product family, based on this platform, is a combination of a microcontroller with digital programmable logic, programmable analog, programmable interconnect, secure expansion of memory off-chip, high-performance analog-to-digital conversion, opamps with Comparator mode, and standard communication and timing peripherals. The PSoC 4200-L products will be fully compatible with members of the PSoC 4 platform for new applications and design needs. The programmable analog and digital subsystems allow flexibility and in-field tuning of the design.

Features

32-bit MCU Subsystem

- 48 MHz ARM Cortex-M0 CPU with single-cycle multiply
- Up to 256 kB of flash with Read Accelerator
- Up to 32 kB of SRAM
- DMA engine with 32 channels

Programmable Analog

- Four opamps that operate in Deep Sleep mode at very low current levels
- All opamps have reconfigurable high current pin-drive, high-bandwidth internal drive, ADC input buffering, and Comparator modes with flexible connectivity allowing input connections to any pin
- Four current DACs (IDACs) for general-purpose or capacitive sensing applications on any pin
- Two low-power comparators that operate in Deep Sleep mode

Programmable Digital

- Eight programmable logic blocks, each with 8 Macrocells and an 8-bit data path (called universal digital blocks or UDBs)
- Cypress-provided peripheral component library, user-defined state machines, and Verilog input

Low Power 1.71 V to 5.5 V Operation

- 20-nA Stop Mode with GPIO pin wakeup
- Hibernate and Deep Sleep modes allow wakeup-time versus power trade-offs

Capacitive Sensing

- Two Cypress Capacitive Sigma-Delta (CSD) blocks provide best-in-class SNR (>5:1) and water tolerance
- Cypress-supplied software component makes capacitive sensing design easy
- Automatic hardware tuning (SmartSense™)

Segment LCD Drive

- LCD drive supported on any pin with up to a maximum of 64 outputs (common or segment)
- Operates in Deep Sleep mode with 4 bits per pin memory

Serial Communication

- Four independent run-time reconfigurable serial communication blocks (SCBs) with reconfigurable I^2C, SPI, or UART functionality
- USB Full-Speed device interface 12 Mbits/sec with Battery Charger Detect capability
- Two independent CAN blocks for industrial and automotive networking

Timing and Pulse-Width Modulation

- Eight 16-bit timer/counter pulse-width modulator (TCPWM) blocks
- Center-aligned, Edge, and Pseudo-random modes
- Comparator-based triggering of Kill signals for motor drive and other high-reliability digital logic applications

Up to 98 Programmable GPIOs

- 124-ball VFBGA, 64-pin TQFP, 48-pin TQFP, and 68-pin QFN packages
- Any of up to 94 GPIO pins can be CapSense, analog, or digital
- Drive modes, strengths, and slew rates are programmable

PSoC Creator Design Environment

- Integrated Development Environment (IDE) provides schematic design entry and build (with analog and digital automatic routing)
- Applications Programming Interface (API component) for all fixed-function and programmable peripherals

Industry-Standard Tool Compatibility

- After schematic entry, development can be done with ARM-based industry-standard development tools

More Information

Cypress provides a wealth of data at www.cypress.com to help you to select the right PSoC device for your design, and to help you to quickly and effectively integrate the device into your design. For a comprehensive list of resources, see the knowledge base article KBA86521, How to Design with PSoC 3, PSoC 4, and PSoC 5LP. Following is an abbreviated list for PSoC 4:

- Overview: PSoC Portfolio, PSoC Roadmap
- Product Selectors: PSoC 1, PSoC 3, PSoC 4, PSoC 5LP
  In addition, PSoC Creator includes a device selection tool.
- Application notes: Cypress offers a large number of PSoC application notes covering a broad range of topics, from basic to advanced level. Recommended application notes for getting started with PSoC 4 are:
  - AN79953: Getting Started With PSoC 4
  - AN88619: PSoC 4 Hardware Design Considerations
  - AN86439: Using PSoC 4 GPIO Pins
  - AN57821: Mixed Signal Circuit Board Layout
  - AN81623: Digital Design Best Practices
  - AN73854: Introduction To Bootloaders
  - AN89610: ARM Cortex Code Optimization
- Technical Reference Manual (TRM) is in two documents:
  - Architecture TRM details each PSoC 4 functional block.
  - Registers TRM describes each of the PSoC 4 registers.
- Development Kits:
  - CY8CKIT-042, PSoC 4 Pioneer Kit, is an easy-to-use and inexpensive development platform. This kit includes connectors for Arduino™ compatible shields and Digilent® Pmod™ daughter cards.
  - CY8CKIT-049 is a very low-cost prototyping platform. It is a low-cost alternative to sampling PSoC 4 devices.
  - CY8CKIT-001 is a common development platform for any one of the PSoC 1, PSoC 3, PSoC 4, or PSoC 5LP families of devices.

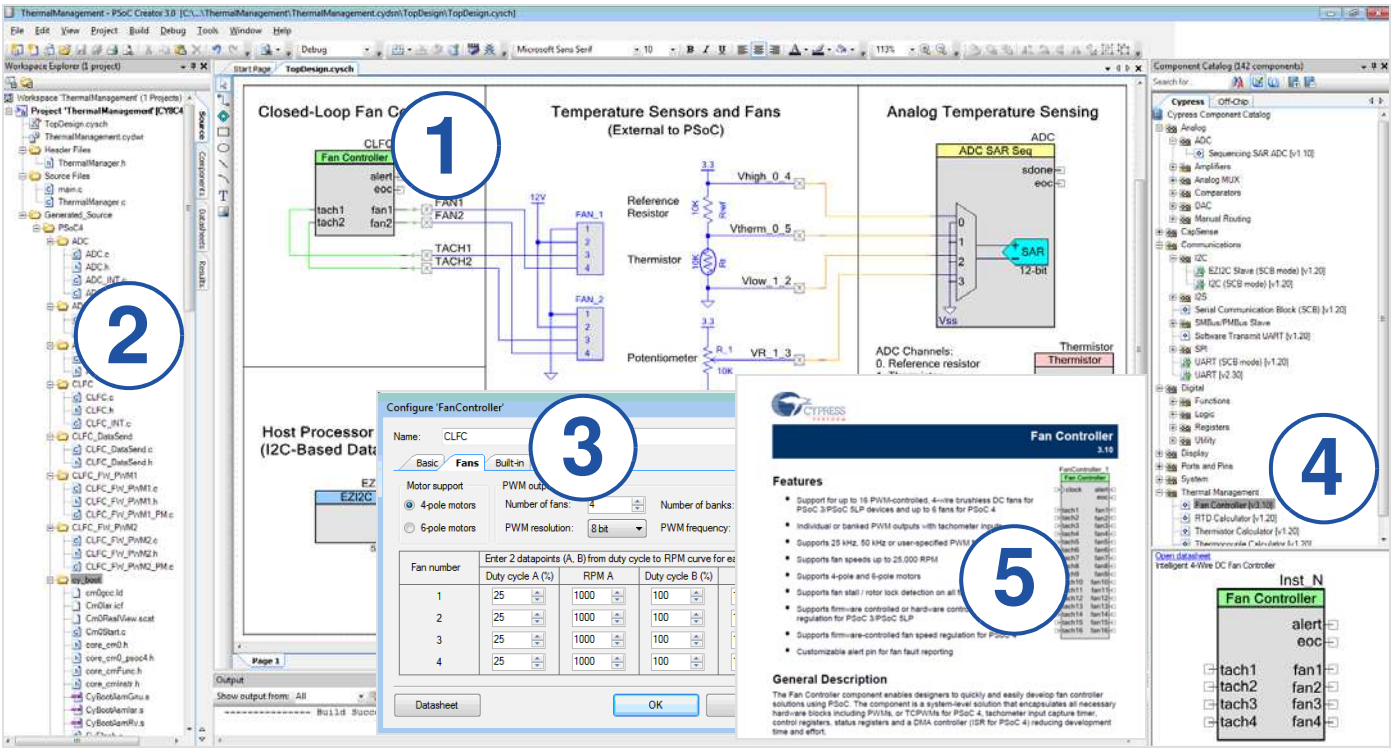
The MiniProg3 device provides an interface for flash programming and debug.

PSoC Creator

PSoC Creator is a free Windows-based Integrated Design Environment (IDE). It enables concurrent hardware and firmware design of PSoC 3, PSoC 4, and PSoC 5LP based systems. Create designs using classic, familiar schematic capture supported by over 100 pre-verified, production-ready PSoC Components; see the list of component datasheets. With PSoC Creator, you can:

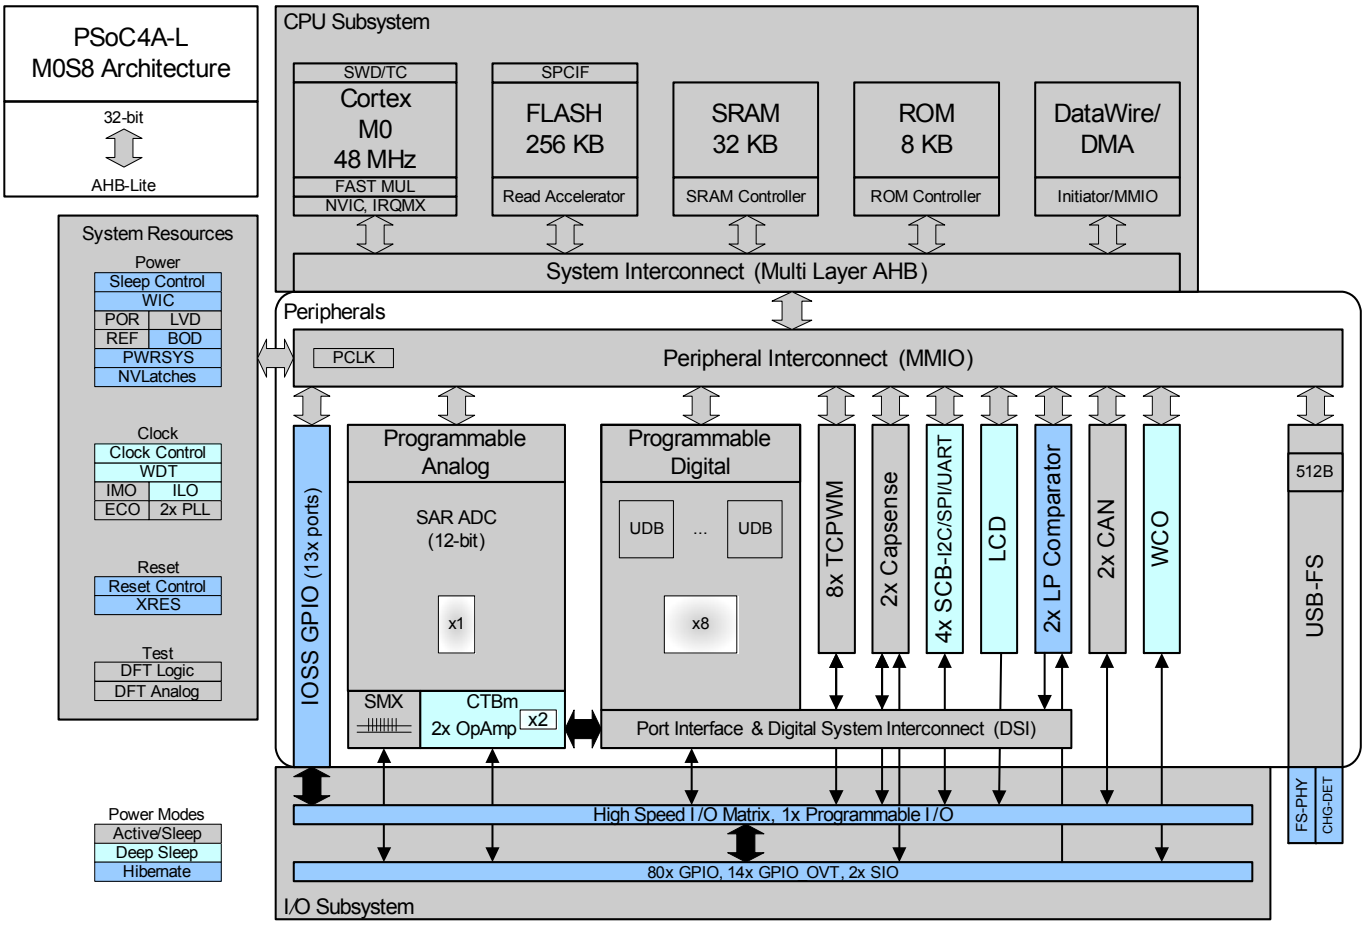
1. Drag and drop component icons to build your hardware system design in the main design workspace
2. Codesign your application firmware with the PSoC hardware, using the PSoC Creator IDE C compiler
3. Configure components using the configuration tools
4. Explore the library of 100+ components
5. Review component datasheets

Figure 1. Multiple-Sensor Example Project in PSoC Creator Contents



Contents

Figure 2. Block Diagram



PSoC 4200-L Block Diagram

The PSoC 4200-L devices include extensive support for programming, testing, debugging, and tracing both hardware and firmware.

The ARM Serial_Wire Debug (SWD) interface supports all programming and debug features of the device.

Complete debug-on-chip functionality enables full-device debugging in the final system using the standard production device. It does not require special interfaces, debugging pods, simulators, or emulators. Only the standard programming connections are required to fully support debug.

The PSoC Creator Integrated Development Environment (IDE) provides fully integrated programming and debug support for PSoC 4200-L devices. The SWD interface is fully compatible with industry-standard third-party tools. The PSoC 4200-L family provides a level of security not possible with multi-chip application solutions or with microcontrollers. This is due to its ability to disable debug features, robust flash protection, and because it allows customer-proprietary functionality to be implemented in on-chip programmable blocks.

The debug circuits are enabled by default and can only be disabled in firmware. If not enabled, the only way to re-enable them is to erase the entire device, clear flash protection, and reprogram the device with new firmware that enables debugging.

Additionally, all device interfaces can be permanently disabled (device security) for applications concerned about phishing attacks due to a maliciously reprogrammed device or attempts to defeat security by starting and interrupting flash programming sequences. Because all programming, debug, and test interfaces are disabled when maximum device security is enabled, PSoC 4200-L with device security enabled may not be returned for failure analysis. This is a trade-off the PSoC 4200-L allows the customer to make.

Functional Definition

CPU and Memory Subsystem

CPU

The Cortex-M0 CPU in the PSoC 4200-L is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating. Most instructions are 16 bits in length and execute a subset of the Thumb-2 instruction set. This enables fully compatible binary upward migration of the code to higher performance processors such as the Cortex-M3 and M4, thus enabling upward compatibility. The Cypress implementation includes a hardware multiplier that provides a 32-bit result in one cycle. It includes a nested vectored interrupt controller (NVIC) block with 32 interrupt inputs and also includes a Wakeup Interrupt Controller (WIC), which can wake the processor up from the Deep Sleep mode allowing power to be switched off to the main processor when the chip is in the Deep Sleep mode. The Cortex-M0 CPU provides a Non-Maskable Interrupt (NMI) input, which is made available to the user when it is not in use for system functions requested by the user.

The CPU also includes a debug interface, the serial wire debug (SWD) interface, which is a 2-wire form of JTAG; the debug configuration used for PSoC 4200-L has four break-point (address) comparators and two watchpoint (data) comparators.

Flash

The PSoC 4200-L has a flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The flash block is designed to deliver 2 wait-state (WS) access time at 48 MHz and with 1-WS access time at 24 MHz. The flash accelerator delivers 85% of single-cycle SRAM access performance on average. Part of the flash module can be used to emulate EEPROM operation if required.

SRAM

SRAM memory is retained during Hibernate.

SROM

A supervisory ROM that contains boot and configuration routines is provided.

DMA

A DMA engine is provided that can do 32-bit transfers and has chainable ping-pong descriptors.

System Resources

Power System

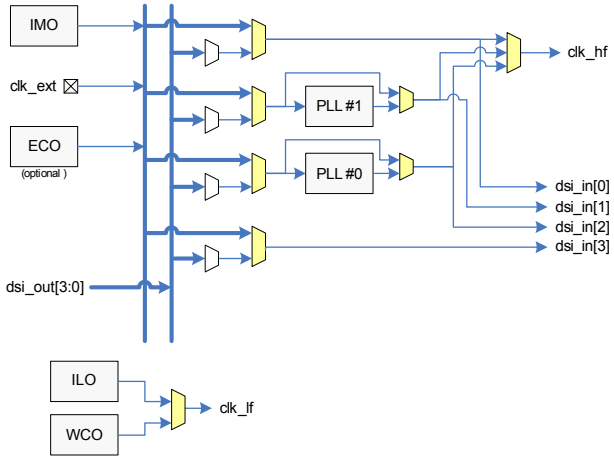
The power system is described in detail in the section Power on page 15. It provides assurance that voltage levels are as required for each respective mode and either delay mode entry (on power-on reset (POR), for example) until voltage levels are as required for proper function or generate resets (brown-out detect (BOD)) or interrupts (low voltage detect (LVD)). The PSoC 4200-L operates with a single external supply over the range of 1.71 to 5.5 V and has five different power modes, transitions between which are managed by the power system. The PSoC 4200-L provides Sleep, Deep Sleep, Hibernate, and Stop low-power modes.

Clock System

The PSoC 4200-L clock system is responsible for providing clocks to all subsystems that require clocks and for switching between different clock sources without glitching. In addition, the clock system ensures that no meta-stable conditions occur.

The clock system for the PSoC 4200-L consists of a crystal oscillator (4 to 33 MHz), a watch crystal oscillator (32 kHz), a phase-locked loop (PLL), the IMO and the ILO internal oscillators, and provision for an external clock.

Figure 3. PSoC 4200-L MCU Clocking Architecture



The clk_hf signal can be divided down to generate synchronous clocks for the UDBs, and the analog and digital peripherals. There are a total of 16 clock dividers for the PSoC 4200-L, each with 16-bit divide capability; this allows 12 to be used for the fixed-function blocks and four for the UDBs. The analog clock leads the digital clocks to allow analog events to occur before digital clock-related noise is generated. The 16-bit capability allows a lot of flexibility in generating fine-grained frequency values and is fully supported in PSoC Creator.

IMO Clock Source

The IMO is the primary source of internal clocking in the PSoC 4200-L. It is trimmed during testing to achieve the specified accuracy. Trim values are stored in nonvolatile latches (NVL). Additional trim settings from flash can be used to compensate for changes. The IMO default frequency is 24 MHz and it can be adjusted between 3 to 48 MHz in steps of 1 MHz. IMO tolerance with Cypress-provided calibration settings is ±2%.

ILO Clock Source

The ILO is a very low power oscillator, nominally 32 kHz, which is primarily used to generate clocks for peripheral operation in Deep Sleep mode. ILO-driven counters can be calibrated to the IMO to improve accuracy. Cypress provides a software component, which does the calibration.

Crystal Oscillators and PLL

The PSoC 4200-L clock subsystem also implements two oscillators: high-frequency (4 to 33 MHz) and low-frequency (32-kHz watch crystal) that can be used for precision timing applications. The PLL can generate a 48-MHz output from the high-frequency oscillator.

Watchdog Timer

A watchdog timer is implemented in the clock block running from the ILO; this allows watchdog operation during Deep Sleep and generates a watchdog reset if not serviced before the timeout occurs. The watchdog reset is recorded in the Reset Cause register.

Reset

The PSoC 4200-L can be reset from a variety of sources including a software reset. Reset events are asynchronous and guarantee reversion to a known state. The reset cause is recorded in a register, which is sticky through reset and allows software to determine the cause of the reset. An XRES pin is reserved for external reset to avoid complications with configuration and multiple pin functions during power-on or reconfiguration.

Voltage Reference

The PSoC 4200-L reference system generates all internally required references. A 1% voltage reference spec is provided for the 12-bit ADC. To allow better signal-to-noise ratios (SNR) and better absolute accuracy, it is possible to add an external bypass capacitor to the internal reference using a GPIO pin or to use an external reference for the SAR.

Analog Blocks

12-bit SAR ADC

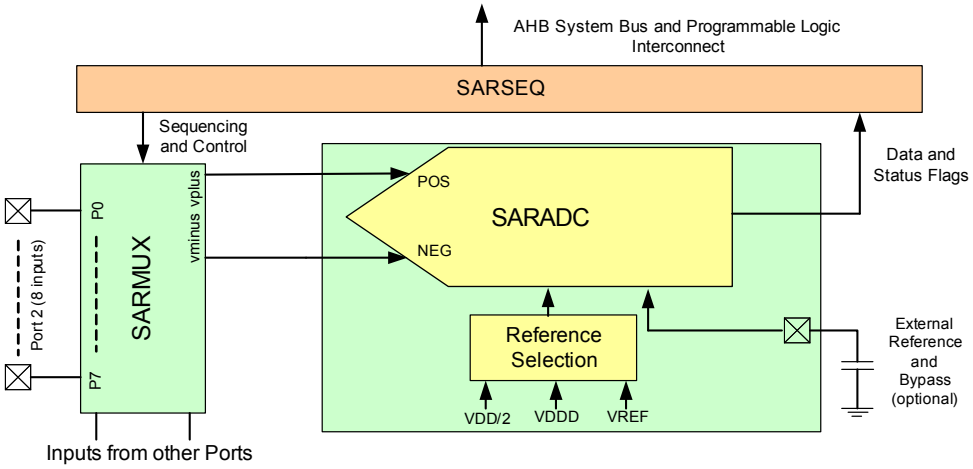
The 12-bit, 1-Msps SAR ADC can operate at a maximum clock rate of 18 MHz and requires a minimum of 18 clocks at that frequency to do a 12-bit conversion.

The block functionality is augmented for the user by adding a reference buffer to it (trimmable to ±1%) and by providing the choice (for the PSoC 4200-L case) of three internal voltage references: V_{DD}, $V_{DD}/2$, and V_{REF} (nominally 1.024 V) as well as an external reference through a GPIO pin. The Sample-and-Hold (S/H) aperture is programmable allowing the gain bandwidth requirements of the amplifier driving the SAR inputs, which determine its settling time, to be relaxed if required. The system performance will be 65 dB for true 12-bit precision if appropriate references are used and system noise levels permit. To improve performance in noisy conditions, it is possible to provide an external bypass (through a fixed pin location) for the internal reference amplifier.

The SAR is connected to a fixed set of pins through an 8-input sequencer (expandable to 16 inputs). The sequencer cycles through selected channels autonomously (sequencer scan) and does so with zero switching overhead (that is, the aggregate sampling bandwidth is equal to 1 Msps, whether it is for a single channel or distributed over several channels). The sequencer switching is effected through a state machine or through firmware-driven switching. A feature provided by the sequencer is buffering of each channel to reduce CPU interrupt service requirements. To accommodate signals with varying source impedance and frequency, it is possible to have different sample times programmable for each channel. In addition, the signal range specification through a pair of range registers (low and high range values) is implemented with a corresponding out-of-range interrupt if the digitized value exceeds the programmed range; this allows fast detection of out-of-range values without the necessity of having to wait for a sequencer scan to be completed and the CPU to read the values and check for out-of-range values in software.

The SAR is able to digitize the output of the on-board temperature sensor for calibration and other temperature-dependent functions. The SAR is not available in Deep Sleep and Hibernate modes as it requires a high-speed clock (up to 18 MHz). The SAR operating range is 1.71 to 5.5 V.

Figure 4. SAR ADC System Diagram



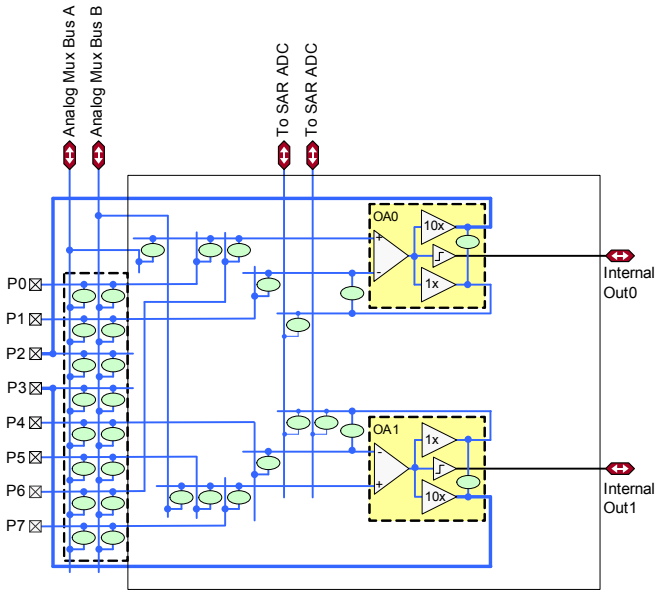
Analog Multiplex Bus

The PSoC4200-L has two concentric analog buses (Analog Mux Bus A and Analog Mux Bus B) that circumnavigate the periphery of the chip. These buses can transport analog signals from any pin to various analog blocks (including the opamps) and to the CapSense blocks allowing, for instance, the ADC to monitor any pin on the chip. These buses are independent and can also be split into three independent sections. This allows one section to be used for CapSense purposes, one for general analog signal processing, and the third for general-purpose digital peripherals and GPIO.

Four Opamps (CTBm Blocks)

The PSoC 4200-L has four opamps with Comparator modes, which allow most common analog functions to be performed on-chip eliminating external components; PGAs, voltage buffers, filters, trans-impedance amplifiers, and other functions can be realized with external passives saving power, cost, and space. The on-chip opamps are designed with enough bandwidth to drive the Sample-and-Hold circuit of the ADC without requiring external buffering. The opamps can operate in the Deep Sleep mode at very low power levels. The following diagram shows one of two identical opamp pairs of the opamp subsystem.

Figure 5. Identical Opamp Pairs in Opamp Subsystem



The ovals in Figure 5 represent analog switches, which may be controlled via user firmware, the SAR sequencer, or user-defined programmable logic. The opamps (OA0 and OA1) are configurable via these switches to perform all standard opamp functions with appropriate feedback components.

The opamps (OA0 and OA1) are programmable and reconfigurable to provide standard opamp functionality via switchable feedback components, unity gain functionality for driving pins directly, or for internal use (such as buffering SAR ADC inputs as indicated in the diagram), or as true comparators.

The opamp inputs provide highly flexible connectivity and can connect directly to dedicated pins or, via the analog mux buses, to any pin on the chip. Analog switch connectivity is controllable by user firmware as well as user-defined programmable digital state machines (implemented via UDBs).

The opamps operate in Deep Sleep mode at very low currents allowing analog circuits to remain operational during Deep Sleep.

Temperature Sensor

The PSoC 4200-L has one on-chip temperature sensor. This consists of a diode, which is biased by a current source that can be disabled to save power. The temperature sensor is connected to the ADC, which digitizes the reading and produces a temperature value using Cypress-supplied software that includes calibration and linearization.

Low-power Comparators

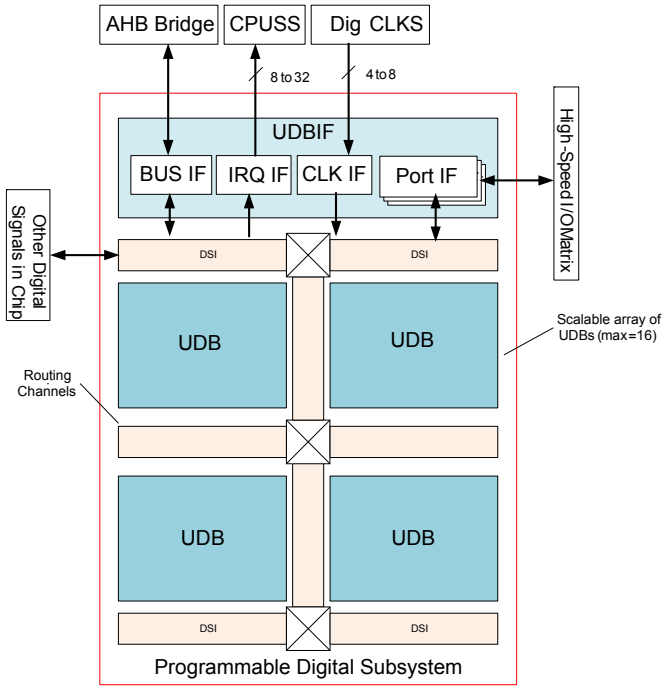
The PSoC 4200-L has a pair of low-power comparators, which can also operate in the Deep Sleep and Hibernate modes. This allows the analog system blocks to be disabled while retaining the ability to monitor external voltage levels during low-power modes. The comparator outputs are normally synchronized to avoid meta-stability unless operating in an asynchronous power mode (Hibernate) where the system wake-up circuit is activated by a comparator switch event.

Programmable Digital

Universal Digital Blocks (UDBs) and Port Interfaces

The PSoC 4200-L has eight UDBs; the UDB array also provides a switched Digital System Interconnect (DSI) fabric that allows signals from peripherals and ports to be routed to and through the UDBs for communication and control. The UDB array is shown in the following figure.

Figure 6. UDB Array

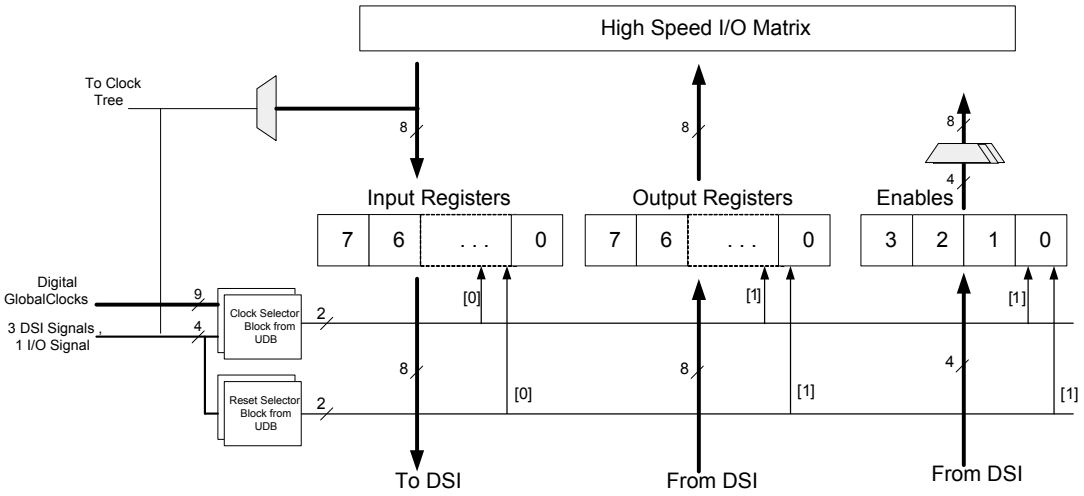


UDBs can be clocked from a clock divider block, from a port interface (required for peripherals such as SPI), and from the DSI network directly or after synchronization.

A port interface is defined, which acts as a register that can be clocked with the same source as the PLDs inside the UDB array. This allows faster operation because the inputs and outputs can be registered at the port interface close to the I/O pins and at the edge of the array. The port interface registers can be clocked by one of the I/Os from the same port. This allows interfaces such as SPI to operate at higher clock speeds by eliminating the delay for the port input to be routed over DSI and used to register other inputs. The port interface is shown in Figure 7.

The UDBs can generate interrupts (one UDB at a time) to the interrupt controller. The UDBs retain the ability to connect to any pin on the chip through the DSI.

Figure 7. Port Interface



Fixed Function Digital

Timer/Counter/PWM (TCPWM) Block

The TCPWM block consists of four 16-bit counters with user-programmable period length. There is a Capture register to record the count value at the time of an event (which may be an I/O event), a period register which is used to either stop or auto-reload the counter when its count is equal to the period register, and compare registers to generate compare value signals, which are used as PWM duty cycle outputs. The block also provides true and complementary outputs with programmable offset between them to allow use as deadband programmable complementary PWM outputs. It also has a Kill input to force outputs to a predetermined state; for example, this is used in motor drive systems when an overcurrent state is indicated and the PWMs driving the FETs need to be shut off immediately with no time for software intervention. The PSoC 4200-L has eight TCPWM blocks.

Serial Communication Blocks (SCB)

The PSoC 4200-L has four SCBs, which can each implement an I^{2}C, UART, or SPI interface.

I^{2}C Mode: The hardware I^{2}C block implements a full multi-master and slave interface (it is capable of multimaster arbitration). This block is capable of operating at speeds of up to 1 Mbps (Fast Mode Plus) and has flexible buffering options to reduce interrupt overhead and latency for the CPU. It also supports EzI2C that creates a mailbox address range in the memory of the PSoC 4200-L and effectively reduces I^{2}C communication to reading from and writing to an array in memory. In addition, the block supports an 8-deep FIFO for receive and transmit which, by increasing the time given for the CPU to read data, greatly reduces the need for clock stretching caused by the CPU not having read data on time. The FIFO mode is available in all channels and is very useful in the absence of DMA.

The I^{2}C peripheral is compatible with the I^{2}C Standard-mode, Fast-mode, and Fast-mode Plus devices as defined in the NXP I^{2}C-bus specification and user manual (UM10204). The I^{2}C bus I/O is implemented with GPIO in open-drain modes.

UART Mode: This is a full-feature UART operating at up to 1 Mbps. It supports automotive single-wire interface (LIN), infrared interface (IrDA), and SmartCard (ISO7816) protocols, all of which are minor variants of the basic UART protocol. In addition, it supports the 9-bit multiprocessor mode that allows addressing of peripherals connected over common RX and TX lines. Common UART functions such as parity error, break detect, and frame error are supported. An 8-deep FIFO allows much greater CPU service latencies to be tolerated.

SPI Mode: The SPI mode supports full Motorola SPI, TI SSP (essentially adds a start pulse used to synchronize SPI Codecs), and National Microwire (half-duplex form of SPI). The SPI block can use the FIFO.

USB Device

A Full-speed USB 2.0 device interface is provided. It has a Control endpoint and eight other endpoints. The interface has a USB transceiver and can be operated from the IMO obviating the need for a crystal oscillator.

CAN Blocks

There are two independent CAN 2.0B blocks, which are certified CAN conformant.

GPIO

The PSoC 4200-L has 96 GPIOs. The GPIO block implements the following:

- Eight drive strength modes including strong push-pull, resistive pull-up and pull-down, weak (resistive) pull-up and pull-down, open drain and open source, input only, and disabled
- Input threshold select (CMOS or LVTTL)
- Individual control of input and output disables
- Hold mode for latching previous state (used for retaining I/O state in Deep Sleep mode and Hibernate modes)
- Selectable slew rates for dV/dt related noise control to improve EMI

The pins are organized in logical entities called ports, which are 8-bit in width. During power-on and reset, the blocks are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network known as a high-speed I/O matrix is used to multiplex between various signals that may connect to an I/O pin. Pin locations for fixed-function peripherals are also fixed to reduce internal multiplexing complexity (these signals do not go through the DSI network). DSI signals are not affected by this and any pin may be routed to any UDB through the DSI network.

Data output and pin state registers store, respectively, the values to be driven on the pins and the states of the pins themselves.

Every I/O pin can generate an interrupt if so enabled and each I/O port has an interrupt request (IRQ) and interrupt service routine (ISR) vector associated with it (13 for PSoC 4200-L).

There are 14 GPIO pins that are overvoltage tolerant (V_{IN} can exceed V_{DD}). The overvoltage cells will not sink more than 10 µA when their inputs exceed V_{DDIO} in compliance with I^2C specifications. Meeting the I^2C minimum fall time requirement for FM and FM+ may require the slower slew rate setting depending on bus loading (also applies to all GPIO and SIO pins).

SIO

The Special I/O (SIO) pins have the following features in addition to the GPIO features:

- Overvoltage protection and hot swap capability
- Programmable switching thresholds
- Programmable output pull-up voltage capability

They allow interfacing to buses, such as I^2C with full I^2C compatibility and interfacing to devices operating at different voltage levels. There are two SIO pins on the PSoC4200-L.

Special Function Peripherals

LCD Segment Drive

The PSoC 4200-L has an LCD controller, which can drive up to eight commons and up to 56 segments. Any pin can be either a common or a segment pin. It uses full digital methods to drive the LCD segments requiring no generation of internal LCD voltages. The two methods used are referred to as digital correlation and PWM.

Digital correlation pertains to modulating the frequency and levels of the common and segment signals to generate the highest RMS voltage across a segment to light it up or to keep the RMS signal zero. This method is good for STN displays but may result in reduced contrast with TN (cheaper) displays.

PWM pertains to driving the panel with PWM signals to effectively use the capacitance of the panel to provide the integration of the modulated pulse-width to generate the desired LCD voltage. This method results in higher power consumption but can result in better results when driving TN displays. LCD operation is supported during Deep Sleep refreshing a small display buffer (4 bits; 1 32-bit register per port).

CapSense

CapSense is supported on all pins in the PSoC 4200-L through two CapSense Sigma-Delta (CSD) blocks that can be connected to any pin through an analog mux bus that any GPIO pin can be connected to via an Analog switch. CapSense function can thus be provided on any pin or group of pins in a system under software control. A component is provided for the CapSense block to make it easy for the user.

Shield voltage can be driven on another Mux Bus to provide water tolerance capability. Water tolerance is provided by driving the shield electrode in phase with the sense electrode to keep the shield capacitance from attenuating the sensed input.

Each CapSense block has two IDACs which can be used for general purposes if CapSense is not being used.(both IDACs are available in that case) or if CapSense is used without water tolerance (one IDAC is available). The two CapSense blocks can be used independently.

Pinouts

The following is the pin list for the PSoC 4200-L.

124-BGA		68-QFN		64-TQFP		48-TQFP		48-TQFP-USB

Port 12 (Port pins 12.0 and 12.1) are SIO pins.

Ports 6 (Port pins P6.0..6.5) and 9 (Port pins 9.0..9.7) are overvoltage tolerant (GPIO_OVT)

Balls C6, D11, H11, H3, L4, and L5 are No Connects (NC) on the 124-BGA package. Pins 11 and 15 are NC on the 48-TQFP packages.

Each of the pins shown in the previous table can have multiple programmable functions as shown in the following table.

Descriptions of the power pin functions are as follows:

VDDD: Power supply for both analog and digital sections (where there is no V_{DDA} pin)

VDDA: Analog V_{DD} pin where package pins allow; shorted to V_{DDD} otherwise

VDDIO: I/O pin power domain

VSSA: Analog ground pin where package pins allow; shorted to VSS otherwise

VSS: Ground pin

VCCD: Regulated digital supply (1.8 V ±5%)

GPIO and GPIO_OVT pins can be used as CSD sense and shield pins (a total of 94). Up to 64 of the pins can be used for LCD drive.

The following packages are supported: 124-ball BGA, 64-pin TQFP, 68-pin QFN, and 48-pin TQFP.

Power

The supply voltage range is 1.71 V to 5.5 V with all functions and circuits operating over that range.

The PSoC 4200-L family allows two distinct modes of power supply operation: Unregulated External Supply and Regulated External Supply modes.

Unregulated External Supply

In this mode, the PSoC 4200-L is powered by an External Power Supply that can be anywhere in the range of 1.8 V to 5.5 V. This range is also designed for battery-powered operation, for instance, the chip can be powered from a battery system that starts at 3.5 V and works down to 1.8 V. In this mode, the internal regulator of the PSoC 4200-L supplies the internal logic and the VCCD output of the PSoC 4200-L must be bypassed to ground via an external Capacitor (in the range of 1 to 1.6 µF; X5R ceramic or better).

VDDA and VDDD must be shorted together on the PC board; the grounds, VSSA and VSS must also be shorted together. Bypass capacitors must be used from VDDD and VDDA to ground, typical practice for systems in this frequency range is to use a capacitor in the 1 µF range in parallel with a smaller capacitor (0.1 µF, for example). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be simulated to design and obtain optimal bypassing.

Power Supply	Bypass Capacitors
VDDD–VSS and VDDIO-VSS	0.1 µF ceramic at each pin plus bulk capacitor 1 to 10 µF.
VDDA–VSSA	0.1 µF ceramic at pin. Additional 1 µF to 10 µF bulk capacitor
VCCD–VSS	1 µF ceramic capacitor at the VCCD pin
VREF–VSSA (optional)	The internal bandgap may be bypassed with a 1 µF to 10 µF capacitor for better ADC performance.

Regulated External Supply

In this mode, the PSoC 4200-L is powered by an external power supply that must be within the range of 1.71 V to 1.89 V (1.8 ±5%); note that this range needs to include power supply ripple. In this mode, the VCCD and VDDD pins are shorted together and bypassed. The internal regulator is disabled in firmware.

Development Support

The PSoC 4200-L family has a rich set of documentation, development tools, and online resources to assist you during your development process. Visit www.cypress.com/go/psoc4 to find out more.

Documentation

A suite of documentation supports the PSoC 4200-L family to ensure that you can find answers to your questions quickly. This section contains a list of some of the key documents.

Software User Guide: A step-by-step guide for using PSoC Creator. The software user guide shows you how the PSoC Creator build process works in detail, how to use source control with PSoC Creator, and much more.

Component Datasheets: The flexibility of PSoC allows the creation of new peripherals (components) long after the device has gone into production. Component data sheets provide all of the information needed to select and use a particular component, including a functional description, API documentation, example code, and AC/DC specifications.

Application Notes: PSoC application notes discuss a particular application of PSoC in depth; examples include brushless DC motor control and on-chip filtering. Application notes often include example projects in addition to the application note document.

Technical Reference Manual: The Technical Reference Manual (TRM) contains all the technical detail you need to use a PSoC device, including a complete description of all PSoC registers.

Online

In addition to print documentation, the Cypress PSoC forums connect you with fellow PSoC users and experts in PSoC from around the world, 24 hours a day, 7 days a week.

Tools

With industry standard cores, programming, and debugging interfaces, the PSoC 4200-L family is part of a development tool ecosystem. Visit us at www.cypress.com/go/psoccreator for the latest information on the revolutionary, easy to use PSoC Creator IDE, supported third party compilers, programmers, debuggers, and development kits.

Electrical Specifications

Absolute Maximum Ratings

Table 1. Absolute Maximum Ratings[1]

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/ Conditions
SID1	V_{DD_ABS}	Analog or digital supply relative to V_{SS} (V_{SSD} = V_{SSA})	–0.5	–	6	V	Absolute maximum
SID2	V_{CCD_ABS}	Direct digital core voltage input relative to V_{SSD}	–0.5	–	1.95	V	Absolute maximum
SID3	V_{GPIO_ABS}	GPIO voltage; V_{DDD} or V_{DDA}	–0.5	–	V_{DD}+0.5	V	Absolute maximum
SID4	I_{GPIO_ABS}	Current per GPIO	–25	–	25	mA	Absolute maximum
SID5	$I_{G-PIO\_injection}$	GPIO injection current per pin	–0.5	–	0.5	mA	Absolute maximum
BID44	ESD_HBM	Electrostatic discharge human body model	2200	–	–	V	
BID45	ESD_CDM	Electrostatic discharge charged device model	500	–	–	V	
BID46	LU	Pin current for latch-up	–140	–	140	mA	

Device Level Specifications

All specifications are valid for -40 °C ≤ TA ≤ 85 °C and TJ ≤ 100 °C, except where noted. Specifications are valid for 1.71 V to 5.5 V, except where noted.

Table 2. DC Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details / Conditions
SID53	V_{DDD}	Power Supply Input Voltage (V_{DDA} = V_{DDD} = V_{DD})	1.8	–	5.5	V	With regulator enabled
SID255	V_{DDD}	Power supply input voltage unregulated	1.71	1.8	1.89	V	Internally unregulated Supply
SID54	V_{CCD}	Output voltage (for core logic)	–	1.8	–	V	
SID55	C_{EFC}	External regulator voltage bypass	1	1.3	1.6	µF	X5R ceramic or better
SID56	C_{EXC}	Power supply decoupling capacitor	–	1	–	µF	X5R ceramic or better
Active Mode							
SID6	I_{DD1}	Execute from flash; CPU at 6 MHz	–	2.2	3.1	mA	
SID7	I_{DD2}	Execute from flash; CPU at 12 MHz	–	3.7	4.8	mA	
SID8	I_{DD3}	Execute from flash; CPU at 24 MHz	–	6.7	8.0	mA	
SID9	I_{DD4}	Execute from flash; CPU at 48 MHz	–	12.8	14.5	mA	
Sleep Mode							
SID21	I_{DD16}	I^2C wakeup, WDT, and Comparators on. Regulator Off.	–	1.8	2.2	mA	V_{DD} = 1.71 to 1.89, 6 MHz
SID22	I_{DD17}	I^2C wakeup, WDT, and Comparators on.	–	1.7	2.1	mA	V_{DD} = 1.8 to 5.5, 6 MHz

Note
1. Usage above the absolute maximum conditions listed in Table 1 may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods of time may affect device reliability. The maximum storage temperature is 150 °C in compliance with JEDEC Standard JESD22-A103, High Temperature Storage Life. When used below absolute maximum conditions but above normal operating conditions, the device may not operate to specification.

Table 2. DC Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details / Conditions
SID23	I_{DD18}	I^2C wakeup, WDT, and Comparators on. Regulator Off.	–	2.4	2.9	mA	V_{DD} = 1.71 to 1.89, 12 MHz
SID24	I_{DD19}	I^2C wakeup, WDT, and Comparators on.	–	2.3	2.8	mA	V_{DD} = 1.8 to 5.5, 12 MHz
Deep Sleep Mode, –40 °C to + 60 °C							
SID30	I_{DD25}	I^2C wakeup and WDT on. Regulator Off.	–	–	13.5	µA	V_{DD} = 1.71 to 1.89
SID31	I_{DD26}	I^2C wakeup and WDT on.	–	1.3	20.0	µA	V_{DD} = 1.8 to 3.6
SID32	I_{DD27}	I^2C wakeup and WDT on.	–	–	20.0	µA	V_{DD} = 3.6 to 5.5
Deep Sleep Mode, +85 °C							
SID33	I_{DD28}	I^2C wakeup and WDT on. Regulator Off.	–	–	45.0	µA	V_{DD} = 1.71 to 1.89
SID34	I_{DD29}	I^2C wakeup and WDT on.	–	15	60.0	µA	V_{DD} = 1.8 to 3.6
SID35	I_{DD30}	I^2C wakeup and WDT on.	–	–	45.0	µA	V_{DD} = 3.6 to 5.5
Hibernate Mode, –40 °C to + 60 °C							
SID39	I_{DD34}	Regulator Off.	–	–	1123	nA	V_{DD} = 1.71 to 1.89
SID40	I_{DD35}		–	150	1600	nA	V_{DD} = 1.8 to 3.6
SID41	I_{DD36}		–	–	1600	nA	V_{DD} = 3.6 to 5.5
Hibernate Mode, +85 °C							
SID42	I_{DD37}	Regulator Off.	–	–	4142	nA	V_{DD} = 1.71 to 1.89
SID43	I_{DD38}		–	–	9700	nA	V_{DD} = 1.8 to 3.6
SID44	I_{DD39}		–	–	10,400	nA	V_{DD} = 3.6 to 5.5
Stop Mode							
SID304	I_{DD43A}	Stop Mode current; V_{DD} = 3.6 V	–	20	659	nA	T = –40 °C to +60 °C
SID304A	I_{DD43B}	Stop Mode current; V_{DD} = 3.6 V	–	–	1810	nA	T = +85 °C
XRES current							
SID307	I_{DD_XR}	Supply current while XRES (Active Low) asserted	–	2	5	mA	

Table 3. AC Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/ Conditions
SID48	F_{CPU}	CPU frequency	DC	–	48	MHz	$1.71 \le V_{DD} \le 5.5$
SID49	T_{SLEEP}	Wakeup from sleep mode	–	0	–	µs	Guaranteed by characterization
SID50	$T_{DEEPSLEEP}$	Wakeup from Deep Sleep mode	–	–	25	µs	24-MHz IMO. Guaranteed by characterization
SID51	$T_{HIBERNATE}$	Wakeup from Hibernate mode	–	–	0.7	ms	Guaranteed by characterization
SID51A	T_{STOP}	Wakeup from Stop mode	–	–	1.9	ms	Guaranteed by characterization
SID52	$T_{RESETWIDTH}$	External reset pulse width	1	–	–	µs	Guaranteed by characterization

GPIO

Table 4. GPIO DC Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/ Conditions
SID57	V_{IH}[2]	Input voltage high threshold	0.7 × V_{DDD}	–	–	V	CMOS Input
SID57A	I_{IHS}	Input current when Pad > V_{DDIO} for OVT inputs	–	–	10	µA	Per I^2C Spec
SID58	V_{IL}	Input voltage low threshold	–	–	0.3 × V_{DDD}	V	CMOS Input
SID241	V_{IH}[2]	LVTTL input, V_{DDD} < 2.7 V	0.7× V_{DDD}	–	–	V	
SID242	V_{IL}	LVTTL input, V_{DDD} < 2.7 V	–	–	0.3 × V_{DDD}	V	
SID243	V_{IH}[2]	LVTTL input, $V_{DDD} \geq 2.7$ V	2.0	–	–	V	
SID244	V_{IL}	LVTTL input, $V_{DDD} \geq 2.7$ V	–	–	0.8	V	
SID59	V_{OH}	Output voltage high level	V_{DDD} –0.6	–	–	V	I_{OH} = 4 mA at 3 V V_{DDD}
SID60	V_{OH}	Output voltage high level	V_{DDD} –0.5	–	–	V	I_{OH} = 1 mA at 1.8 V V_{DDD}
SID61	V_{OL}	Output voltage low level	–	–	0.6	V	I_{OL} = 4 mA at 1.8 V V_{DDD}
SID62	V_{OL}	Output voltage low level	–	–	0.6	V	I_{OL} = 8 mA at 3 V V_{DDD}
SID62A	V_{OL}	Output voltage low level	–	–	0.4	V	I_{OL} = 3 mA at 3 V V_{DDD}
SID63	R_{PULLUP}	Pull-up resistor	3.5	5.6	8.5	kΩ	
SID64	$R_{PULLDOWN}$	Pull-down resistor	3.5	5.6	8.5	kΩ	
SID65	I_{IL}	Input leakage current (absolute value)	–	–	2	nA	25 °C, V_{DDD} = 3.0 V
SID65A	I_{IL_CTBM}	Input leakage current (absolute value) for CTBM pins	–	–	4	nA	
SID66	C_{IN}	Input capacitance	–	–	7	pF	Not applicable for P6.4, P6.5, P12.0, P12.1, and for USB pins.
SID67	V_{HYSTTL}	Input hysteresis LVTTL	25	40	–	mV	$V_{DDD} \geq 2.7$ V
SID68	$V_{HYSCMOS}$	Input hysteresis CMOS	0.05 × V_{DDD}	–	–	mV	
SID69	I_{DIODE}	Current through protection diode to V_{DD}/Vss	–	–	100	µA	Guaranteed by characterization
SID69A	I_{TOT_GPIO}	Maximum Total Source or Sink Chip Current	–	–	200	mA	Guaranteed by characterization

Note
2. V_{IH} must not exceed V_{DDD} + 0.2 V.

Table 5. GPIO AC Specifications

(Guaranteed by Characterization)[3]

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/ Conditions
SID70	T_{RISEF}	Rise time in fast strong mode	2	–	12	ns	3.3 V V_{DDD}, Cload = 25 pF
SID71	T_{FALLF}	Fall time in fast strong mode	2	–	12	ns	3.3 V V_{DDD}, Cload = 25 pF
SID72	T_{RISES}	Rise time in slow strong mode	10	–	60	ns	3.3 V V_{DDD}, Cload = 25 pF
SID73	T_{FALLS}	Fall time in slow strong mode	10	–	60	ns	3.3 V V_{DDD}, Cload = 25 pF
SID74	$F_{GPIOUT1}$	GPIO Fout;3.3 V ≤ V_{DDD} ≤ 5.5 V. Fast strong mode.	–	–	33	MHz	90/10%, 25 pF load, 60/40 duty cycle
SID75	$F_{GPIOUT2}$	GPIO Fout;1.7 V≤ V_{DDD}≤ 3.3 V. Fast strong mode.	–	–	16.7	MHz	90/10%, 25 pF load, 60/40 duty cycle
SID76	$F_{GPIOUT3}$	GPIO Fout;3.3 V ≤ V_{DDD} ≤ 5.5 V. Slow strong mode.	–	–	7	MHz	90/10%, 25 pF load, 60/40 duty cycle
SID245	$F_{GPIOUT4}$	GPIO Fout;1.7 V ≤ V_{DDD} ≤ 3.3 V. Slow strong mode.	–	–	3.5	MHz	90/10%, 25 pF load, 60/40 duty cycle
SID246	F_{GPIOIN}	GPIO input operating frequency; 1.71 V ≤ V_{DDD} ≤ 5.5 V	–	–	48	MHz	90/10% V_{IO}

XRES

Table 6. XRES DC Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/ Conditions
SID77	V_{IH}	Input voltage high threshold	0.7 × V_{DDD}	–	–	V	CMOS Input
SID78	V_{IL}	Input voltage low threshold	–	–	0.3 × V_{DDD}	V	CMOS Input
SID79	R_{PULLUP}	Pull-up resistor	3.5	5.6	8.5	kΩ	
SID80	C_{IN}	Input capacitance	–	3	–	pF	
SID81	$V_{HYSXRES}$	Input voltage hysteresis	–	100	–	mV	Guaranteed by characterization
SID82	I_{DIODE}	Current through protection diode to V_{DDD}/V_{SS}	–	–	100	µA	Guaranteed by characterization

Table 7. XRES AC Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/ Conditions
SID83	$T_{RESETWIDTH}$	Reset pulse width	1	–	–	µs	Guaranteed by characterization

Note

3. Simultaneous switching transitions on many fully-loaded GPIO pins may cause ground perturbations depending on several factors including PCB and decoupling capacitor design. For applications that are very sensitive to ground perturbations, the slower GPIO slew rate setting may be used.

Analog Peripherals

Opamp

Table 8. Opamp Specifications

(Guaranteed by Characterization)

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
	I_{DD}	Opamp block current. No load.	–	–	–	–	
SID269	I_{DD_HI}	Power = high	–	1100	1850	µA	
SID270	I_{DD_MED}	Power = medium	–	550	950	µA	
SID271	I_{DD_LOW}	Power = low	–	150	350	µA	
	GBW	Load = 20 pF, 0.1 mA. V_{DDA} = 2.7 V	–	–	–	–	
SID272	GBW_HI	Power = high	6	–	–	MHz	
SID273	GBW_MED	Power = medium	4	–	–	MHz	
SID274	GBW_LO	Power = low	–	1	–	MHz	
	I_{OUT_MAX}	$V_{DDA} \geq 2.7$ V, 500 mV from rail	–	–	–	–	
SID275	$I_{OUT\_MAX\_HI}$	Power = high	10	–	–	mA	
SID276	$I_{OUT\_MAX\_MID}$	Power = medium	10	–	–	mA	
SID277	$I_{OUT\_MAX\_LO}$	Power = low	–	5	–	mA	
	I_{OUT}	V_{DDA} = 1.71 V, 500 mV from rail	–	–	–	–	
SID278	$I_{OUT\_MAX\_HI}$	Power = high	4	–	–	mA	
SID279	$I_{OUT\_MAX\_MID}$	Power = medium	4	–	–	mA	
SID280	$I_{OUT\_MAX\_LO}$	Power = low	–	2	–	mA	
SID281	V_{IN}	Input voltage range	–0.05	–	V_{DDA}– 0.2	V	Charge-pump on, $V_{DDA} \geq$ 2.7 V
SID282	V_{CM}	Input common mode voltage	–0.05	–	VDDA – 0.2	V	Charge-pump on, $V_{DDA} \geq$ 2.7 V
	V_{OUT}	$V_{DDA} \geq 2.7$ V	–	–	–		
SID283	V_{OUT_1}	Power = high, I_{load}=10 mA	0.5	–	VDDA – 0.5	V	
SID284	V_{OUT_2}	Power = high, I_{load}=1 mA	0.2	–	VDDA – 0.2	V	
SID285	V_{OUT_3}	Power = medium, I_{load}=1 mA	0.2	–	VDDA – 0.2	V	
SID286	V_{OUT_4}	Power = low, I_{load}=0.1mA	0.2	–	VDDA – 0.2	V	
SID288	V_{OS_TR}	Offset voltage, trimmed	1	±0.5	1	mV	High mode
SID288A	V_{OS_TR}	Offset voltage, trimmed	–	±1	–	mV	Medium mode
SID288B	V_{OS_TR}	Offset voltage, trimmed	–	±2	–	mV	Low mode
SID290	$V_{OS\_DR\_TR}$	Offset voltage drift, trimmed	–10	±3	10	µV/°C	High mode
SID290A	$V_{OS\_DR\_TR}$	Offset voltage drift, trimmed	–	±10	–	µV/°C	Medium mode
SID290B	$V_{OS\_DR\_TR}$	Offset voltage drift, trimmed	–	±10	–	µV/°C	Low mode
SID291	CMRR	DC	60	70	–	dB	V_{DDD} = 3.6 V
SID292	PSRR	At 1 kHz, 100 mV ripple	70	85	–	dB	VDDD = 3.6 V
	Noise		–	–	–	–	
SID293	V_{N1}	Input referred, 1 Hz - 1GHz, power = high	–	94	–	µVrms	
SID294	V_{N2}	Input referred, 1 kHz, power = high	–	72	–	nV/rtHz	

Table 8. Opamp Specifications

(Guaranteed by Characterization) *(continued)*

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
SID295	V_{N3}	Input referred, 10kHz, power = high	–	28	–	nV/rtHz	
SID296	V_{N4}	Input referred, 100kHz, power = high	–	15	–	nV/rtHz	
SID297	Cload	Stable up to maximum load. Performance specs at 50 pF.	–	–	125	pF	
SID298	Slew_rate	Cload = 50 pF, Power = High, $V_{DDA} \geq 2.7$ V	6	–	–	V/µs	
SID299	T_op_wake	From disable to enable, no external RC dominating	–	25	–	µs	
SID299A	OL_GAIN	Open Loop Gain	–	90	–	dB	
	Comp_mode	Comparator mode; 50 mV drive, $T_{rise} = T_{fall}$ (approx.)	–	–	–		
SID300	T_{PD1}	Response time; power = high	–	150	–	ns	
SID301	T_{PD2}	Response time; power = medium	–	400	–	ns	
SID302	T_{PD3}	Response time; power = low	–	2000	–	ns	
SID303	Vhyst_op	Hysteresis	–	10	–	mV	
Deep Sleep Mode		Mode 2 is lowest current range. Mode 1 has higher GBW.					Deep Sleep mode $V_{DDA} \geq 2.7$ V.
SID_DS_1	IDD_HI_M1	Mode 1, High current	–	1400	–	µA	25 °C
SID_DS_2	IDD_MED_M1	Mode 1, Medium current	–	700	–	µA	25 °C
SID_DS_3	IDD_LOW_M1	Mode 1, Low current	–	200	–	µA	25 °C
SID_DS_4	IDD_HI_M2	Mode 2, High current	–	120	–	µA	25 °C
SID_DS_5	IDD_MED_M2	Mode 2, Medium current	–	60	–	µA	25 °C
SID_DS_6	IDD_LOW_M2	Mode 2, Low current	–	15	–	µA	25 °C
SID_DS_7	GBW_HI_M1	Mode 1, High current	–	4	–	MHz	20-pF load, no DC load 0.2 V to V_{DDA}-1.5 V
SID_DS_8	GBW_MED_M1	Mode 1, Medium current	–	2	–	MHz	20-pF load, no DC load 0.2 V to V_{DDA}-1.5 V
SID_DS_9	GBW_LOW_M1	Mode 1, Low current	–	0.5	–	MHz	20-pF load, no DC load 0.2 V to V_{DDA}-1.5 V
SID_DS_10	GBW_HI_M2	Mode 2, High current	–	0.5	–	MHz	20-pF load, no DC load 0.2 V to V_{DDA}-1.5 V
SID_DS_11	GBW_MED_M2	Mode 2, Medium current	–	0.2	–	MHz	20-pF load, no DC load 0.2 V to V_{DDA}-1.5 V
SID_DS_12	GBW_LOW_M2	Mode 2, Low current	–	0.1	–	MHz	20-pF load, no DC load 0.2 V to V_{DDA}-1.5 V
SID_DS_13	VOS_HI_M1	Mode 1, High current	–	5	–	mV	With trim 25 °C, 0.2 V to V_{DDA}-1.5 V
SID_DS_14	VOS_MED_M1	Mode 1, Medium current	–	5	–	mV	With trim 25 °C, 0.2 V to V_{DDA}-1.5 V
SID_DS_15	VOS_LOW_M2	Mode 1, Low current	–	5	–	mV	With trim 25 °C, 0.2 V to V_{DDA}-1.5 V
SID_DS_16	VOS_HI_M2	Mode 2, High current	–	5	–	mV	With trim 25 °C, 0.2 V to V_{DDA}-1.5 V
SID_DS_17	VOS_MED_M2	Mode 2, Medium current	–	5	–	mV	With trim 25 °C, 0.2 V to V_{DDA}-1.5 V

Table 8. Opamp Specifications

(Guaranteed by Characterization) *(continued)*

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
SID_DS_18	VOS_LOW_M2	Mode 2, Low current	–	5	–	mV	With trim 25 °C, 0.2 V to V_{DDA}-1.5 V
SID_DS_19	IOUT_HI_M!	Mode 1, High current	–	10	–	mA	Output is 0.5 V to V_{DDA}-0.5 V
SID_DS_20	IOUT_MED_M1	Mode 1, Medium current	–	10	–	mA	Output is 0.5 V to V_{DDA}-0.5 V
SID_DS_21	IOUT_LOW_M1	Mode 1, Low current	–	4	–	mA	Output is 0.5 V to V_{DDA}-0.5 V
SID_DS_22	IOUT_HI_M2	Mode 2, High current	–	1	–	mA	Output is 0.5 V to V_{DDA}-0.5 V
SID_DS_23	IOU_MED_M2	Mode 2, Medium current	–	1	–	mA	Output is 0.5 V to V_{DDA}-0.5 V
SID_DS_24	IOU_LOW_M2	Mode 2, Low current	–	0.5	–	mA	Output is 0.5 V to V_{DDA}-0.5 V

Comparator

Table 9. Comparator DC Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
SID85	$V_{OFFSET2}$	Input offset voltage. Custom trim. Common mode voltage range from 0 to V_{DD}-1.	–	–	±4	mV	
SID85A	$V_{OFFSET3}$	Input offset voltage. Ultra low-power mode.	–	±12	–	mV	$V_{DDD} \geq 2.2$ V for Temp < 0 °C, $V_{DDD} \geq 1.8$ V for Temp > 0 °C
SID86	V_{HYST}	Hysteresis when enabled. Common mode voltage range from 0 to V_{DD} -1.	–	10	35	mV	Guaranteed by characterization
SID87	V_{ICM1}	Input common mode voltage in normal mode	0	–	V_{DDD} – 0.2	V	Modes 1 and 2.
SID247	V_{ICM2}	Input common mode voltage in low power mode	0	–	V_{DDD}	V	
SID247A	V_{ICM2}	Input common mode voltage in ultra low power mode	0	–	V_{DDD} – 1.15	V	$V_{DDD} \geq 2.2$ V for Temp < 0 °C, $V_{DDD} \geq 1.8$ V for Temp > 0 °C
SID88	CMRR	Common mode rejection ratio	50	–	–	dB	$V_{DDD} \geq 2.7$ V. Guaranteed by characterization
SID88A	CMRR	Common mode rejection ratio	42	–	–	dB	$V_{DDD} < 2.7$ V. Guaranteed by characterization
SID89	I_{CMP1}	Block current, normal mode	–	280	400	µA	Guaranteed by characterization
SID248	I_{CMP2}	Block current, low power mode	–	50	100	µA	Guaranteed by characterization
SID259	I_{CMP3}	Block current, ultra low power mode	–	6	28	µA	Guaranteed by characterization, $V_{DDD} \geq 2.2$ V for Temp < 0 °C, $V_{DDD} \geq 1.8$ V for Temp > 0 °
SID90	Z_{CMP}	DC input impedance of comparator	35	–	–	MΩ	Guaranteed by characterization

Table 10. Comparator AC Specifications

(Guaranteed by Characterization)

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
SID91	T_{RESP1}	Response time, normal mode	–	38	110	ns	50-mV overdrive
SID258	T_{RESP2}	Response time, low power mode	–	70	200	ns	50-mV overdrive
SID92	T_{RESP3}	Response time, ultra low power mode	–	2.3	15	µs	200-mV overdrive. $V_{DDD} \geq 2.2$ V for Temp < 0 °C, $V_{DDD} \geq 1.8$ V for Temp > 0 °C

Temperature Sensor

Table 11. Temperature Sensor Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
SID93	$T_{SENSACC}$	Temperature sensor accuracy	–5	±1	+5	°C	–40 to +85 °C

SAR ADC

Table 12. SAR ADC DC Specifications

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
SID94	A_RES	Resolution	–	–	12	bits	
SID95	A_CHNIS_S	Number of channels - single ended	–	–	16		8 full speed
SID96	A-CHNKS_D	Number of channels - differential	–	–	8		Diff inputs use neighboring I/O
SID97	A-MONO	Monotonicity	–	–	–		Yes. Based on characterization
SID98	A_GAINERR	Gain error	–	–	±0.1	%	With external reference.
SID99	A_OFFSET	Input offset voltage	–	–	2	mV	Measured with 1-V V_{REF}.
SID100	A_ISAR	Current consumption	–	–	1	mA	
SID101	A_VINS	Input voltage range - single ended	V_{SS}	–	V_{DDA}	V	Based on device characterization
SID102	A_VIND	Input voltage range - differential	V_{SS}	–	V_{DDA}	V	Based on device characterization
SID103	A_INRES	Input resistance	–	–	2.2	KΩ	Based on device characterization
SID104	A_INCAP	Input capacitance	–	–	10	pF	Based on device characterization

Table 13. SAR ADC AC Specifications

(Guaranteed by Characterization)

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
SID106	A_PSRR	Power supply rejection ratio	70	–	–	dB	
SID107	A_CMRR	Common mode rejection ratio	66	–	–	dB	Measured at 1 V
SID108	A_SAMP_1	Sample rate with external reference bypass cap	–	–	1	Msps	
SID108A	A_SAMP_2	Sample rate with no bypass cap. Reference = V_{DD}	–	–	500	Ksps	

Table 13. SAR ADC AC Specifications

(Guaranteed by Characterization) *(continued)*

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
SID108B	A_SAMP_3	Sample rate with no bypass cap. Internal reference	–	–	100	ksps	
SID109	A_SNDR	Signal-to-noise and distortion ratio (SINAD)	65	–	–	dB	F_{IN} = 10 kHz
SID111	A_INL	Integral non linearity	–1.7	–	+2	LSB	V_{DD} = 1.71 to 5.5, 1 Msps, Vref = 1 to 5.5.
SID111A	A_INL	Integral non linearity	–1.5	–	+1.7	LSB	V_{DDD} = 1.71 to 3.6, 1 Msps, Vref = 1.71 to V_{DDD}.
SID111B	A_INL	Integral non linearity	–1.5	–	+1.7	LSB	V_{DDD} = 1.71 to 5.5, 500 ksps, Vref = 1 to 5.5.
SID112	A_DNL	Differential non linearity	–1	–	+2.2	LSB	V_{DDD} = 1.71 to 5.5, 1 Msps, Vref = 1 to 5.5.
SID112A	A_DNL	Differential non linearity	–1	–	+2	LSB	V_{DDD} = 1.71 to 3.6, 1 Msps, Vref = 1.71 to V_{DDD}.
SID112B	A_DNL	Differential non linearity	–1	–	+2.2	LSB	V_{DDD} = 1.71 to 5.5, 500 ksps, Vref = 1 to 5.5.
SID113	A_THD	Total harmonic distortion	–	–	–65	dB	F_{IN} = 10 kHz.

CSD

Table 14. CSD Block Specification

Spec ID#	Parameter	Description	Min	Typ	Max	Units	Details/Conditions
CSD Specification							
SID308	VCSD	Voltage range of operation	1.71	–	5.5	V	
SID309	IDAC1	DNL for 8-bit resolution	–1	–	1	LSB	
SID310	IDAC1	INL for 8-bit resolution	–3	–	3	LSB	
SID311	IDAC2	DNL for 7-bit resolution	–1	–	1	LSB	
SID312	IDAC2	INL for 7-bit resolution	–3	–	3	LSB	
SID313	SNR	Ratio of counts of finger to noise. Guaranteed by characterization	5	–	–	Ratio	Capacitance range of 9 to 35 pF, 0.1 pF sensitivity
SID314	IDAC1_CRT1	Output current of Idac1 (8-bits) in High range	–	612	–	µA	
SID314A	IDAC1_CRT2	Output current of Idac1(8-bits) in Low range	–	306	–	µA	
SID315	IDAC2_CRT1	Output current of Idac2 (7-bits) in High range	–	304.8	–	µA	
SID315A	IDAC2_CRT2	Output current of Idac2 (7-bits) in Low range	–	152.4	–	µA
