

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Single-Chip Bluetooth Low Energy-Only System-On-Chip with Support for Wireless Charging

The Cypress CYW20737 is an advanced Bluetooth low energy (aka Bluetooth Smart) SoC that supports wireless charging, includes advanced security features and introduces new software support for NFC pairing. The CYW20737 is designed to support the entire spectrum of Bluetooth Smart use cases for the medical, home automation, accessory, sensor, Internet Of Things, and wearable market segments.

The CYW20737 radio has been designed to provide low power, low cost, and robust communications for applications operating in the globally available 2.4 GHz unlicensed Industrial, Scientific, and Medical (ISM) band.

The single-chip Bluetooth low energy SoC is a monolithic component implemented in a standard digital CMOS process and requires minimal external components to make a fully compliant Bluetooth device. The CYW20737 is available in a 32-pin, 5 mm × 5 mm 32-QFN package as well as WLBGA SIP and die packages.

Cypress Part Numbering Scheme

Cypress is converting the acquired IoT part numbers from Cypress to the Cypress part numbering scheme. Due to this conversion, there is no change in form, fit, or function as a result of offering the device with Cypress part number marking. The table provides Cypress ordering part number that matches an existing IoT part number.

Table 1. Mapping Table for Part Number between Broadcom and Cypress

Broadcom Part Number	Cypress Part Number
BCM20737	CYW20737
BCM20737A1KML2G	CYW20737A1KML2G

Features

- Alliance for Wireless Power (A4WP) wireless charging
- Support for RSA encryption/decryption and key exchange mechanisms (up to 4 kbit)
- Support for X.509 certificate exchange
- Support for NFC tag-based "tap-to-pair"
- Support for Bluetooth Smart Based Audio
- Bluetooth low energy (BLE)-compliant
- Infrared modulator
- IR learning
- Supports Adaptive Frequency Hopping
- Excellent receiver sensitivity
- 10-bit auxiliary ADC with nine analog channels
- On-chip support for serial peripheral interface (master and slave modes)
- Broadcom Serial Communications interface (compatible with Philips® I²C slaves)
- Programmable output power control
- Integrated ARM® Cortex™-M3 based microprocessor core
- Automation Profile
- Support for secure OTA
- On-chip power-on reset (POR)
- Support for EEPROM and serial flash interfaces
- Integrated low-dropout regulator (LDO)
- On-chip software controlled power management unit
- Package type:
 - 32-pin 32-QFN package (5 mm × 5 mm)
- RoHS compliant

Applications

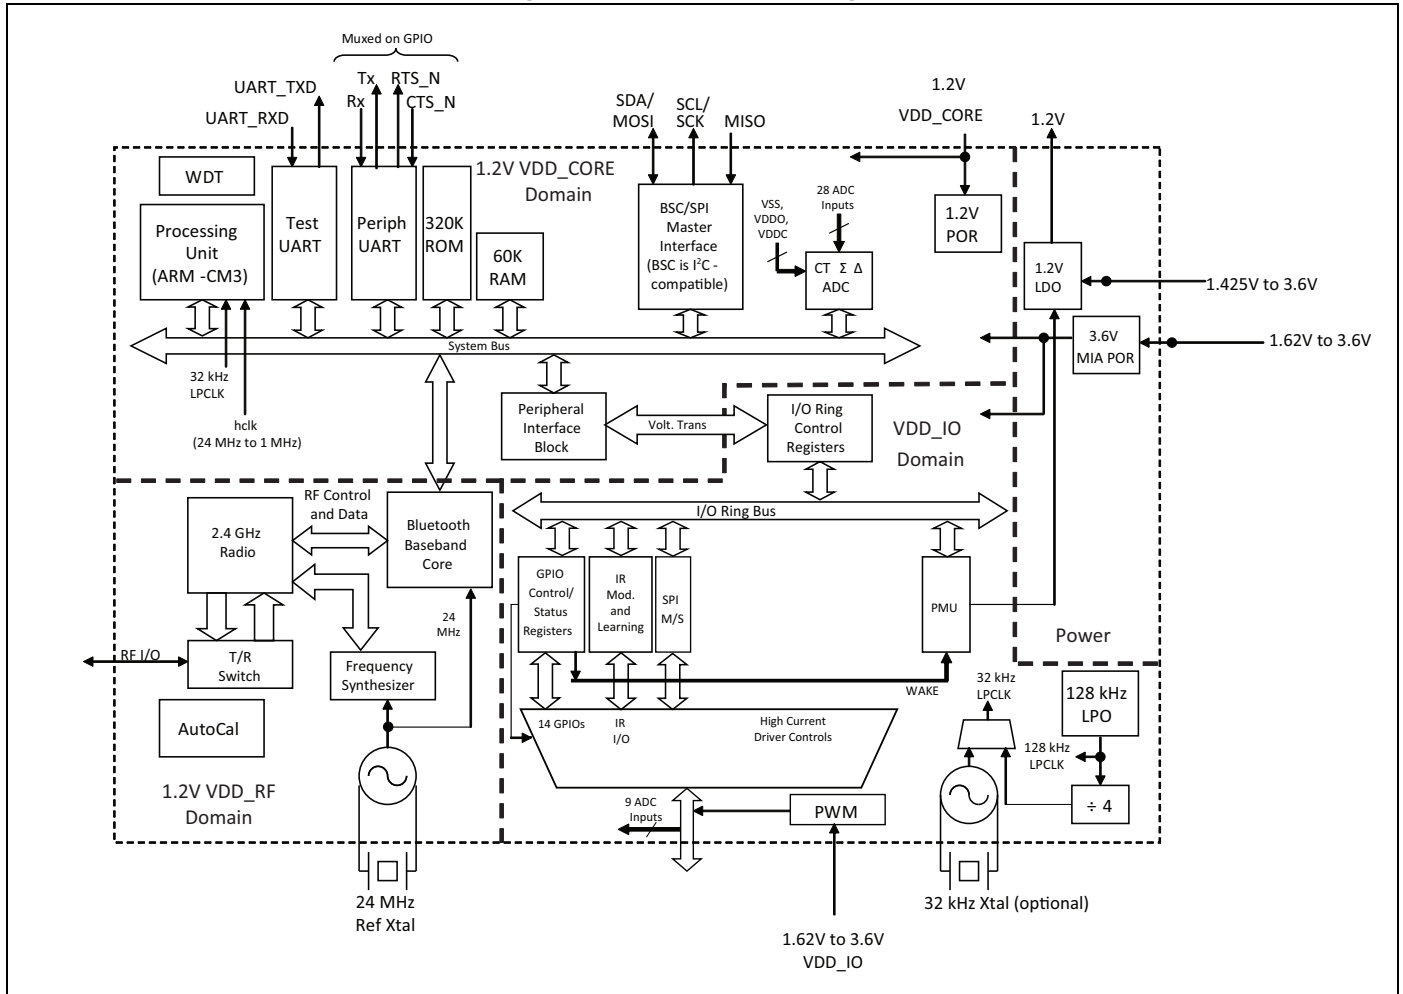

The following profiles are supported¹ in ROM:

- Battery status
- Blood pressure monitor
- Find me
- Heart rate monitor

1.Full qualification and use of these profiles may require FW updates from Broadcom. Some of these profiles are under development/approval at the Bluetooth SIG and conformity with the final approved version is pending. Contact your supplier for updates and the latest list of profiles.

- Proximity
 - Thermometer
 - Weight scale
 - Time
- Additional profiles that can be supported^a from RAM include:
- Blood glucose monitor
 - Location
 - Temperature alarm

1. Functional Description

1.1 Bluetooth Baseband Core

The Bluetooth Baseband Core (BBC) implements all of the time-critical functions required for high performance Bluetooth operation. The BBC manages the buffering, segmentation, and data routing for all connections. It also buffers data that passes through it, handles data flow control, schedules ACL TX/RX transactions, monitors Bluetooth slot usage, optimally segments and packages data into baseband packets, manages connection status indicators, and composes and decodes HCI packets. In addition to these functions, it independently handles HCI event types and HCI command types.

The following transmit and receive functions are also implemented in the BBC hardware to increase TX/RX data reliability and security before sending over the air:

- Receive Functions: symbol timing recovery, data deframing, forward error correction (FEC), header error control (HEC), cyclic redundancy check (CRC), data decryption, and data dewatering.
- Transmit Functions: data framing, FEC generation, HEC generation, CRC generation, link key generation, data encryption, and data whitening.

1.1.1 Frequency Hopping Generator

The frequency hopping sequence generator selects the correct hopping channel number depending on the link controller state, Bluetooth clock, and device address.

1.1.2 E0 Encryption

The encryption key and the encryption engine are implemented using dedicated hardware to reduce software complexity and provide minimal processor intervention.

1.1.3 Link Control Layer

The link control layer is part of the Bluetooth link control functions that are implemented in dedicated logic in the Link Control Unit (LCU). This layer consists of the Command Controller, which takes software commands, and other controllers that are activated or configured by the Command Controller to perform the link control tasks. Each task performs a different Bluetooth link controller state. STANDBY and CONNECTION are the two major states. In addition, there are five substates: page, page scan, inquiry, and inquiry scan.

1.1.4 Adaptive Frequency Hopping

The CYW20737 gathers link quality statistics on a channel-by-channel basis to facilitate channel assessment and channel map selection. The link quality is determined by using both RF and baseband signal processing to provide a more accurate frequency hop map.

1.1.5 Bluetooth Low Energy Profiles

The CYW20737 supports Bluetooth low energy, including the following profiles that are supported² in ROM:

- Battery status
- Blood pressure monitor
- Find me
- Heart rate monitor
- Proximity
- Thermometer
- Weight scale
- Time
- Alliance for Wireless Power (A4WP) wireless charging

2. Full qualification and use of these profiles may require FW updates from Broadcom. Some of these profiles are under development/approval at the Bluetooth SIG and conformity with the final approved version is pending. Contact your supplier for updates and the latest list of profiles.

- Automation profile
- Support for secure OTA

The following additional profiles can be supported² from RAM:

- Blood glucose monitor
- Temperature alarm
- Location
- Custom profile

1.1.6 Test Mode Support

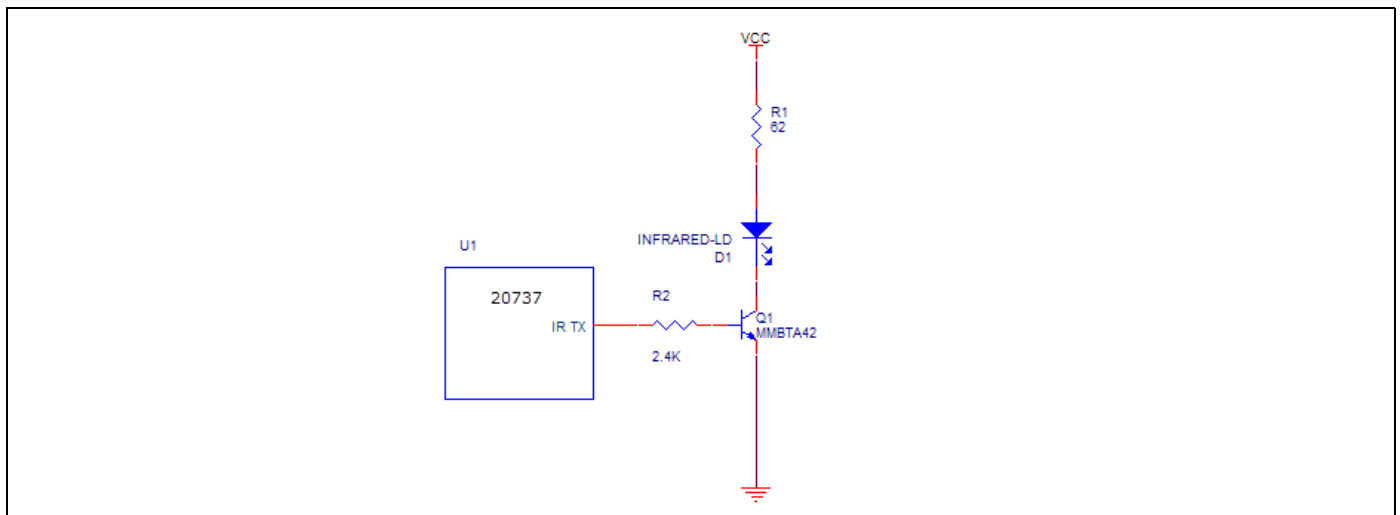

The CYW20737 fully supports Bluetooth Test mode, as described in the Bluetooth low energy specification.

1.2 Infrared Modulator

The CYW20737 includes hardware support for infrared TX. The hardware can transmit both modulated and unmodulated waveforms. For modulated waveforms, hardware inserts the desired carrier frequency into all IR transmissions. IR TX can be sourced from firmware-supplied descriptors, a programmable bit, or the peripheral UART transmitter.

If descriptors are used, they include IR on/off state and the duration between 1–32767 μ sec. The CYW20737 IR TX firmware driver inserts this information in a hardware FIFO and makes sure that all descriptors are played out without a glitch due to underrun (see [Figure 2](#)).

Figure 2. Infrared TX

1.3 Infrared Learning

The CYW20737 includes hardware support for infrared learning. The hardware can detect both modulated and unmodulated signals. For modulated signals, the CYW20737 can detect carrier frequencies between 10 kHz– 500 kHz and the duration that the signal is present or absent. The CYW20737 firmware driver supports further analysis and compression of learned signal. The learned signal can then be played back through the CYW20737 IR TX subsystem (see [Figure 3](#)).

Figure 3. Infrared RX

1.4 Wireless Charging

The CYW20737 includes support for wireless charging in hardware, software, and firmware. It supports the protocol for implementing wireless charging solutions based on the specifications written by the Alliance for Wireless Power (A4WP).

The A4WP protocol is embedded in the CYW20737. Hardware and firmware elements required for wireless charging are either implemented in the CYW20737 or can be obtained through a Broadcom technical support representative (see [page 8](#)).

An end-to-end charging solution comprises of the following:

- **Power Transmitting Unit (PTU):** The PTU transfers the power to the receiving unit. The receiving unit is any device (phone, wearable, or other embedded device) that needs to be charged. The PTU is typically plugged into a power source such as a wall outlet. The CYW20737 includes the peripherals needed to implement and drive a reference charging circuit and otherwise requires only a few external components. PTU reference designs based on the CYW20737, including bills of material (BOMs), are available through Broadcom technical support. Depending on charging power requirements, a Power Management Unit (PMU) such as the BCM8935X may be included in the design. However, most PTUs requiring < 5W will not need a PMU. The references designs leverage ADCs, PWMs, and other internal peripherals to help drive the charging circuitry for energy transfer as well as provide feedback for charging control. The application and algorithm that drive the reference designs are available on request.
- **Power Receive Unit (PRU):** The PRU receives energy from the PTU to charge the local device, and is typically embedded in the local device. Like the PTU, a separate PMU may or may not be needed depending on power requirements. PRU reference designs based on the BCM20736, both with and without a PMU, are also available through Broadcom technical support.

1.5 Security

CYW20737 provides elaborate mechanisms for implementing security and authentication schemes using:

- RSA (Public Key Cryptography)
- X.509 (excluding parsing)
- Hash functions: MD5, SHA-1, SHA-224, SHA-256, SHA-384, SHA-512
- Message authentication code: HMAC MD5, HMAC SHA-1

Note: Details on how to use this functionality via SDK are available in application notes on this topic.

1.6 Support for NFC Tag Based Pairing

CYW20737 provides support for "ease of pairing" and "secure key exchange" use cases using passive tags. Active tags can be used with the chip for OOB pairing. In a typical use case, the BCM20203 (NFC tag) can be used to provide "tap to pair" functionality for easy pairing.

Note: Details on how to use this functionality via SDK are available in application notes on this topic.

1.7 Bluetooth Smart Audio

CYW20737 supports using the BLE link for audio streaming. This functionality can be used for audio applications in toys, wearable, and HID devices, as well as in hearing aids.

Note: Details on how to use this functionality via SDK are available in application notes on this topic.

1.8 ADC Port

The CYW20737 contains a 16-bit ADC (effective number of bits is 10).

Additionally:

- There are 9 analog input channels in the 32-pin package
- The following GPIOs can be used as ADC inputs:
 - P0
 - P1
 - P8/P33 (select only one)
 - P11
 - P12
 - P13/P28 (select only one)
 - P14/P38 (select only one)
 - P15
 - P32
- The conversion time is 10 μ s.
- There is a built-in reference with supply- or bandgap-based reference modes.
- The maximum conversion rate is 187 kHz.
- There is a rail-to-rail input swing.

The ADC consists of an analog ADC core that performs the actual analog-to-digital conversion and digital hardware that processes the output of the ADC core into valid ADC output samples. Directed by the firmware, the digital hardware also controls the input multiplexers that select the ADC input signal V_{inp} and the ADC reference signals V_{ref} .

The ADC input range is selectable by firmware control:

- When an input range of 0–3.6V is used, the input impedance is 3 M Ω .
- When an input range of 0–2.4V is used, the input impedance is 1.84 M Ω .
- When an input range of 0–1.2V is used, the input impedance is 680 k Ω .

ADC modes are defined in [Table 2](#).

Table 2. ADC Modes

Mode	ENOB (Typical)	Maximum Sampling Rate (kHz)	Latency ^a (μ s)
0	13	5.859	171
1	12.6	11.7	85
2	12	46.875	21
3	11.5	93.75	11
4	10	187	5

a. Settling time after switching channels.

1.9 Serial Peripheral Interface

The CYW20737 has two independent SPI interfaces. One is a master-only interface and the other can be either a master or a slave. Each interface has a 16-byte transmit buffer and a 16-byte receive buffer. To support more flexibility for user applications, the CYW20737 has optional I/O ports that can be configured individually and separately for each functional pin as shown in [Table 3](#), [Table 4](#), and [Table 5](#). The CYW20737 acts as an SPI master device that supports 1.8V or 3.3V SPI slaves. The CYW20737 can also act as an SPI slave device that supports a 1.8V or 3.3V SPI master.

Table 3. CYW20737 First SPI Set (Master Mode)

Pin Name	SPI_CLK	SPI_MOSI	SPI_MISO ^a	SPI_CS ^b
Configured Pin Name	SCL	SDA	–	–
	–	–	–	–
	–	–	P32	P33 ^c

a. SPIFFY1 MISO should always be P32. Boot ROM does not configure any others.

b. Any GPIO can be used as SPI_CS when SPI 1 is in master mode, and when the SPI slave is not a serial flash.

c. P33 is always SPI_CS when a serial flash is used for non-volatile storage.

Table 4. CYW20737 Second SPI Set (Master Mode)

Pin Name	SPI_CLK	SPI_MOSI	SPI_MISO	SPI_CS ^a
Configured Pin Name	P3	P0	P1	–
	–	P4	P25	–
	P24	P27	–	–

a. Any GPIO can be used as SPI_CS when SPI is in master mode.

Table 5. CYW20737 Second SPI Set (Slave Mode)

Pin Name	SPI_CLK	SPI_MOSI	SPI_MISO	SPI_CS
Configured Pin Name	P3	P0	P1	P2
	–	P27	–	–
	P24	P33	P25	P26
	–	–	–	P32

1.10 Microprocessor Unit

The CYW20737 microprocessor unit (μ PU) executes software from the link control (LC) layer up to the application layer components. The microprocessor is based on an ARM® Cortex™ M3, 32-bit RISC processor with embedded ICE-RT debug and JTAG interface units. The μ PU has 320 KB of ROM for program storage and boot-up, 60 KB of RAM for scratch-pad data, and patch RAM code. The SoC has a total storage of 380 KB, including RAM and ROM.

The internal boot ROM provides power-on reset flexibility, which enables the same device to be used in different HID applications with an external serial EEPROM or with an external serial flash memory. At power-up, the lowest layer of the protocol stack is executed from the internal ROM memory.

External patches may be applied to the ROM-based firmware to provide flexibility for bug fixes and feature additions. The device can also support the integration of user applications.

1.10.1 EEPROM Interface

The CYW20737 provides a Broadcom Serial Control (BSC) master interface. BSC is programmed by the CPU to generate four types of bus transfers: read-only, write-only, combined read/write, and combined write/read. BSC supports both low-speed and fast mode devices. BSC is compatible with an NXP® I²C slave device, except that master arbitration (multiple I²C masters contending for the bus) is not supported.

The EEPROM can contain customer application configuration information including application code, configuration data, patches, pairing information, BD_ADDR, baud rate, SDP service record, and file system information used for code.

Native support for the Microchip® 24LC128, Microchip 24AA128, and ST Micro® M24128-BR is included.

1.10.2 Serial Flash Interface

The CYW20737 includes an SPI master controller that can be used to access serial flash memory. The SPI master contains an AHB slave interface, transmit and receive FIFOs, and the SPI core PHY logic.

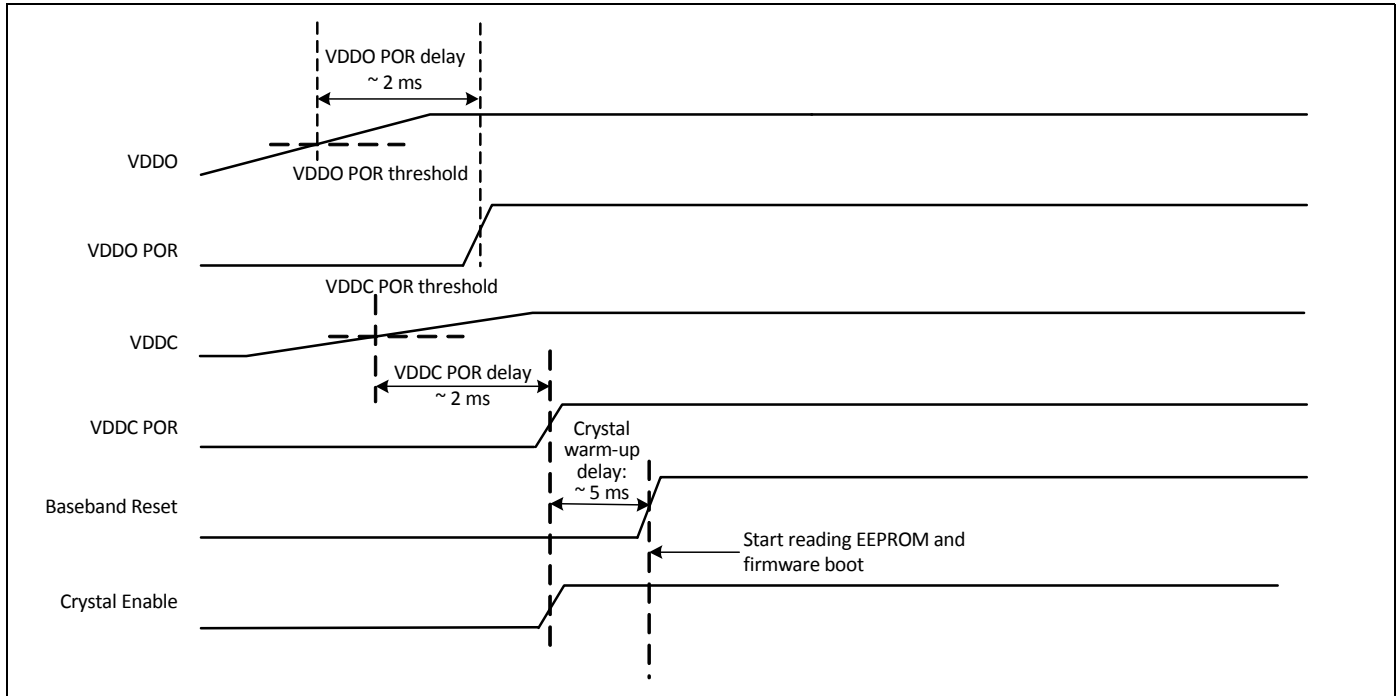

Devices natively supported include the following:

- Atmel® AT25BCM512B
- MXIC® MX25V512ZUI-20G

Other (larger) serial flash parts from MXIC, Numonyx, and Adesto with commands identical to these parts here are also supported.

1.10.3 Internal Reset

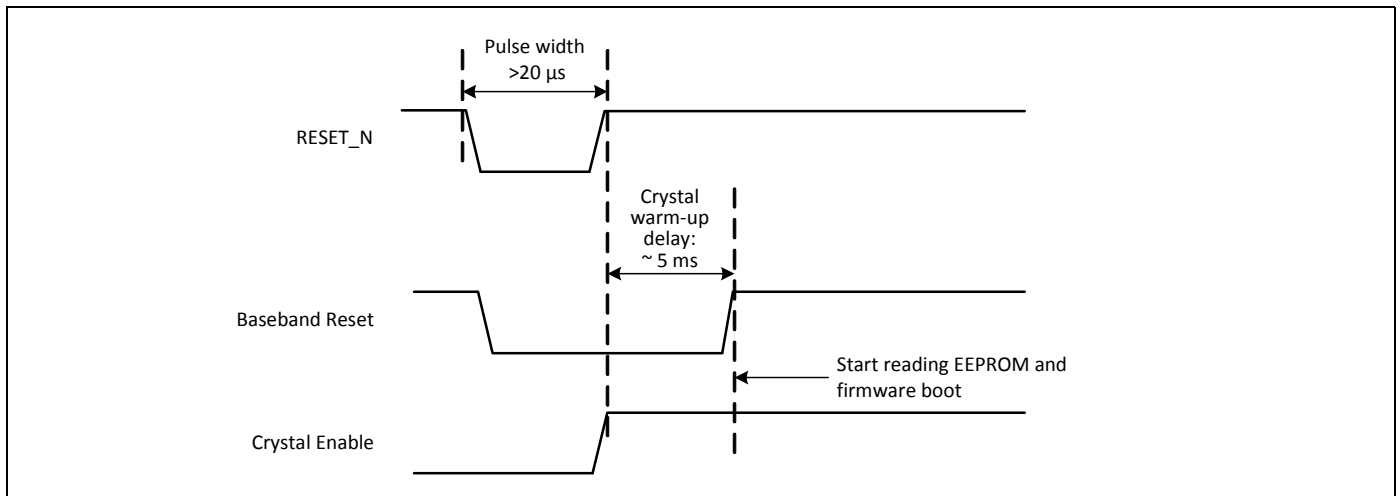

Figure 4. Internal Reset Timing

1.10.4 External Reset

The CYW20737 has an integrated power-on reset circuit that completely resets all circuits to a known power-on state. An external active low reset signal, RESET_N, can be used to put the CYW20737 in the reset state. The RESET_N pin has an internal pull-up resistor and, in most applications, it does not require that anything be connected to it. RESET_N should only be released after the VDDO supply voltage level has been stabilized.

Figure 5. External Reset Timing

1.11 Integrated Radio Transceiver

The CYW20737 has an integrated radio transceiver that is optimized for 2.4 GHz Bluetooth wireless systems. It has been designed to provide low power, low cost, and robust communications for applications operating in the globally available 2.4 GHz unlicensed ISM band. It is fully compliant with Bluetooth Radio Specification 4.0 and meets or exceeds the requirements to provide the highest communication link quality of service.

1.11.1 Transmitter Path

The CYW20737 features a fully integrated transmitter. The baseband transmit data is GFSK modulated in the 2.4 GHz ISM band.

Digital Modulator

The digital modulator performs the data modulation and filtering required for the GFSK signal. The fully digital modulator minimizes any frequency drift or anomalies in the modulation characteristics of the transmitted signal.

Power Amplifier

The CYW20737 has an integrated power amplifier (PA) that can transmit up to +4 dBm for class 2 operation.

1.11.2 Receiver Path

The receiver path uses a low IF scheme to downconvert the received signal for demodulation in the digital demodulator and bit synchronizer. The receiver path provides a high degree of linearity, an extended dynamic range, and high-order, on-chip channel filtering to ensure reliable operation in the noisy 2.4 GHz ISM band. The front-end topology, which has built-in out-of-band attenuation, enables the CYW20737 to be used in most applications without off-chip filtering.

Digital Demodulator and Bit Synchronizer

The digital demodulator and bit synchronizer take the low-IF received signal and perform an optimal frequency tracking and bit synchronization algorithm.

Receiver Signal Strength Indicator

The radio portion of the CYW20737 provides a receiver signal strength indicator (RSSI) to the baseband. This enables the controller to take part in a Bluetooth power-controlled link by providing a metric of its own receiver signal strength to determine whether the transmitter should increase or decrease its output power.

1.11.3 Local Oscillator

The local oscillator (LO) provides fast frequency hopping (1600 hops/second) across the 79 maximum available channels. The CYW20737 uses an internal loop filter.

1.11.4 Calibration

The CYW20737 radio transceiver features a self-contained automated calibration scheme. No user interaction is required during normal operation or during manufacturing to provide optimal performance. Calibration compensates for filter, matching network, and amplifier gain and phase characteristics to yield radio performance within 2% of what is optimal. Calibration takes process and temperature variations into account, and it takes place transparently during normal operation and hop setting times.

1.11.5 Internal LDO Regulator

The CYW20737 has an integrated 1.2V LDO regulator that provides power to the digital and RF circuits. The 1.2V LDO regulator operates from a 1.425V to 3.63V input supply with a 30 mA maximum load current.

Note: Always place the decoupling capacitors near the pins as closely together as possible.

1.12 Peripheral Transport Unit

1.12.1 Broadcom Serial Communications Interface

The CYW20737 provides a 2-pin master BSC interface, which can be used to retrieve configuration information from an external EEPROM or to communicate with peripherals such as track-ball or touch-pad modules, and motion tracking ICs used in mouse devices. The BSC interface is compatible with I²C slave devices. The BSC does not support multimaster capability or flexible wait-state insertion by either master or slave devices.

The following transfer clock rates are supported by the BSC:

- 100 kHz
- 400 kHz
- 800 kHz (not a standard I²C-compatible speed.)
- 1 MHz (Compatibility with high-speed I²C-compatible devices is not guaranteed.)

The following transfer types are supported by the BSC:

- Read (Up to 16 bytes can be read.)
- Write (Up to 16 bytes can be written.)
- Read-then-Write (Up to 16 bytes can be read and up to 16 bytes can be written.)
- Write-then-Read (Up to 16 bytes can be written and up to 16 bytes can be read.)

Hardware controls the transfers, requiring minimal firmware setup and supervision.

The clock pin (SCL) and data pin (SDA) are both open-drain I/O pins. Pull-up resistors external to the CYW20737 are required on both the SCL and SDA pins for proper operation.

1.12.2 UART Interface

The UART is a standard 2-wire interface (RX and TX) and has adjustable baud rates from 9600 bps to 1.5 kbps. The baud rate can be selected via a vendor-specific UART HCI command. The interface supports the Bluetooth 3.0 UART HCI (H4) specification. The default baud rate for H4 is 115.2 kbaud.

Both high and low baud rates can be supported by running the UART clock at 24 MHz.

The CYW20737 UART operates correctly with the host UART as long as the combined baud rate error of the two devices is within ±5%.

1.13 Clock Frequencies

The CYW20737 is set with crystal frequency of 24 MHz.

1.13.1 Crystal Oscillator

The crystal oscillator requires a crystal with an accuracy of ±20 ppm as defined by the Bluetooth specification. Two external load capacitors in the range of 5 pF to 30 pF (see Figure 6) are required to work with the crystal oscillator. The selection of the load capacitors is crystal-dependent. Table 6 shows the recommended crystal specifications.

Figure 6. Recommended Oscillator Configuration—12 pF Load Crystal

Table 6 shows the recommended crystal specifications.

Table 6. Reference Crystal Electrical Specifications

Parameter	Conditions	Minimum	Typical	Maximum	Unit
Nominal frequency	–	–	24.000	–	MHz
Oscillation mode	–	Fundamental			–
Frequency tolerance	@25°C	–	±10	–	ppm
Tolerance stability over temp	@0°C to +70°C	–	±10	–	ppm
Equivalent series resistance	–	–	–	50	Ω
Load capacitance	–	–	12	–	pF
Operating temperature range	–	0	–	+70	°C
Storage temperature range	–	–40	–	+125	°C
Drive level	–	–	–	200	μW
Aging	–	–	–	±10	ppm/year
Shunt capacitance	–	–	–	2	pF

Peripheral Block

The peripheral blocks of the CYW20737 all run from a single 128 kHz low-power RC oscillator. The oscillator can be turned on at the request of any of the peripherals. If the peripheral is not enabled, it shall not assert its clock request line.

The keyboard scanner is a special case, in that it may drop its clock request line even when enabled, and then reassert the clock request line if a keypress is detected.

32 kHz Crystal Oscillator

Figure 7 shows the 32 kHz crystal (XTAL) oscillator with external components and Table 7 lists the oscillator’s characteristics. It is a standard Pierce oscillator using a comparator with hysteresis on the output to create a single-ended digital output. The hysteresis was added to eliminate any chatter when the input is around the threshold of the comparator and is ~100 mV. This circuit can be operated with a 32 kHz or 32.768 kHz crystal oscillator or be driven with a clock input at similar frequency. The default component values are: R1 = 10 MΩ, C1 = C2 = ~10 pF. The values of C1 and C2 are used to fine-tune the oscillator.

Figure 7. 32 kHz Oscillator Block Diagram

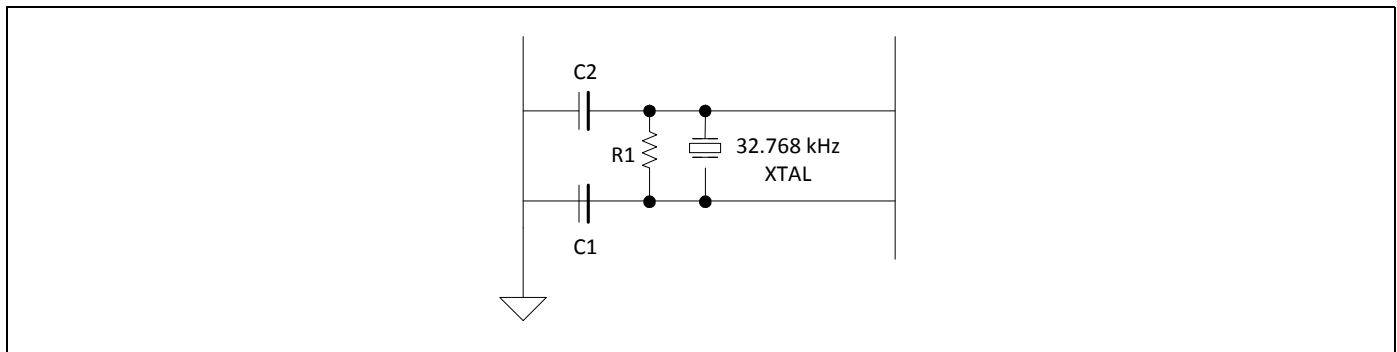

Table 7. XTAL Oscillator Characteristics

Parameter	Symbol	Conditions	Minimum	Typical	Maximum	Unit
Output frequency	F_{oscout}	–	–	32.768	–	kHz
Frequency tolerance	–	Crystal dependent	–	100	–	ppm
Start-up time	T_{startup}	–	–	–	500	ms
XTAL drive level	P_{drv}	For crystal selection	0.5	–	–	μW
XTAL series resistance	R_{series}	For crystal selection	–	–	70	k Ω
XTAL shunt capacitance	C_{shunt}	For crystal selection	–	–	1.3	pF

1.14 GPIO Port

The CYW20737 has 14 general-purpose I/Os (GPIOs) in the 32-pin package. All GPIOs support programmable pull-up and pull-down resistors, and all support a 2 mA drive strength except P26, P27, and P28, which provide a 16 mA drive strength at 3.3V supply.

The following GPIOs are available:

- P0–P4
- P8/P33 (Dual bonded, only one of two is available.)
- P11/P27 (Dual bonded, only one of two is available.)
- P12/P26 (Dual bonded, only one of two is available.)
- P13/P28 (Dual bonded, only one of two is available.)
- P14/P38 (Dual bonded, only one of two is available.)
- P15
- P24
- P25
- P32

For a description of all GPIOs, see [Table 9. “GPIO Pin Descriptions”](#).

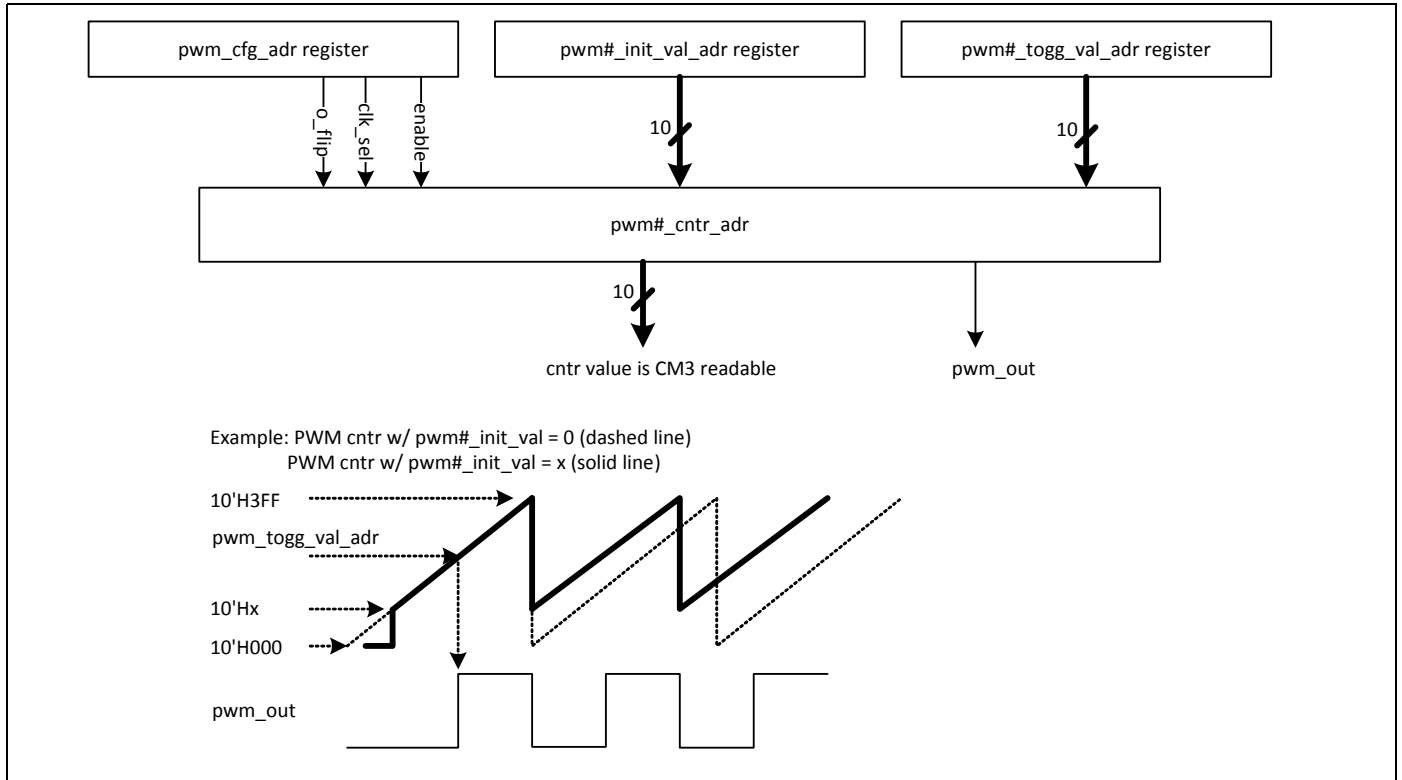

1.15 PWM

The CYW20737 has four internal PWM channels. The PWM module is described as follows:

- PWM0–3
- The following GPIOs can be mapped as PWMs:
 - P26
 - P27
 - P14/P28 (Dual bonded, only one of two is available.)
 - P13
- Each of the PWM channels, PWM0–3, contains the following registers:
 - 10-bit initial value register (read/write)
 - 10-bit toggle register (read/write)
 - 10-bit PWM counter value register (read)
- The PWM configuration register is shared among PWM0–3 (read/write). This 12-bit register is used:
 - To configure each PWM channel.
 - To select the clock of each PWM channel.
 - To change the phase of each PWM channel.

Figure 8 shows the structure of one PWM channel.

Figure 8. PWM Channel Block Diagram

1.16 Power Management Unit

The Power Management Unit (PMU) provides power management features that can be invoked by software through power management registers or packet-handling in the baseband core.

1.16.1 RF Power Management

The BBC generates power-down control signals for the transmit path, receive path, PLL, and power amplifier to the 2.4 GHz transceiver, which then processes the power-down functions accordingly.

1.16.2 Host Controller Power Management

Power is automatically managed by the firmware based on input device activity. As a power-saving task, the firmware controls the disabling of the on-chip regulator when in deep sleep mode.

1.16.3 BBC Power Management

There are several low-power operations for the BBC:

- Physical layer packet handling turns RF on and off dynamically within packet TX and RX.
- Bluetooth-specified low-power connection mode. While in these low-power connection modes, the CYW20737 runs on the Low Power Oscillator and wakes up after a predefined time period.

The CYW20737 automatically adjusts its power dissipation based on user activity. The following power modes are supported:

- Active mode
- Idle mode
- Sleep mode
- HIDOFF (Deep Sleep) mode
- Timed Deep Sleep mode

The CYW20737 transitions to the next lower state after a programmable period of user inactivity. Busy mode is immediately entered when user activity resumes.

In HIDOFF (Deep Sleep) mode, the CYW20737 baseband and core are powered off by disabling power to LDOOUT. The VDDO domain remains powered up and will turn the remainder of the chip on when it detects user events. This mode minimizes chip power consumption and is intended for long periods of inactivity.

2. Pin Assignments

2.1 Pin Descriptions

Table 8. Pin Descriptions

Pin Number	Pin Name	I/O	Power Domain	Description
Radio I/O				
6	RF	I/O	VDD_RF	RF antenna port
RF Power Supplies				
4	VDDIF	I	VDD_RF	IFPLL power supply
5	VDDFE	I	VDD_RF	RF front-end supply
7	VDDVCO	I	VDD_RF	VCO, LOGEN supply
8	VDDPLL	I	VDD_RF	RFPLL and crystal oscillator supply
Power Supplies				
11	VDDC	I	VDDC	Baseband core supply
28	VDDO	I	VDDO	I/O pad and core supply
14	VDDM	I	VDDM	I/O pad supply
Clock Generator and Crystal Interface				
9	XTALI	I	VDD_RF	Crystal oscillator input. See page 12 for options.
10	XTALO	O	VDD_RF	Crystal oscillator output.
1	XTALI32K	I	VDDO	Low-power oscillator (LPO) input is used. Alternative Function: <ul style="list-style-type: none"> ■ P11 ■ P27
32	XTALO32K	O	VDDO	Low-power oscillator (LPO) output. Alternative Function: <ul style="list-style-type: none"> ■ P12 ■ P26
Core				
18	RESET_N	I/O PU	VDDO	Active-low system reset with open-drain output & internal pull-up resistor
17	TMC	I	VDDO	Test mode control High: test mode Connect to GND if not used.
UART				
12	UART_RXD	I	VDDM	UART serial input – Serial data input for the HCI UART interface. Leave unconnected if not used. Alternative function: <ul style="list-style-type: none"> ■ GPIO3
13	UART_TXD	O, PU	VDDM	UART serial output – Serial data output for the HCI UART interface. Leave unconnected if not used. Alternative Function: <ul style="list-style-type: none"> ■ GPIO2

Table 8. Pin Descriptions (Cont.)

Pin Number	Pin Name	I/O	Power Domain	Description
BSC				
15	SDA	I/O, PU	VDDM	Data signal for an external I ² C device. Alternative function: <ul style="list-style-type: none"> ■ SPI_1: MOSI (master only) ■ GPIO0 ■ CTS
16	SCL	I/O, PU	VDDM	Clock signal for an external I ² C device. Alternative function: <ul style="list-style-type: none"> ■ SPI_1: SPI_CLK (master only) ■ GPIO1 ■ RTS
LDO Regulator Power Supplies				
2	LDOIN	I	N/A	Battery input supply for the LDO
3	LDOOUT	O	N/A	LDO output

a. During power-on reset, all inputs are disabled.

2.2 GPIO Pin Multiplexing

Table 10 provides GPIO pin multiplexing information.

Table 10. GPIO Pin Multiplexing

GPIO Pin	Alternate Functions						
	1	2	3	4	5	6	7
	Input/ Output	Outputs		Inputs			
P0	–	PUART_TX	SPI_2: MOSI(master)	–	ADC_IN29	IR_RX/60 Hz_main	SPI_2: MOSI (slave)
P1	IR_TX	PUART_RTS	SPI_2: MISO (slave)	–	ADC_IN28	–	SPI_2: MISO (master)
P2	–	SPI_2: MOSI(master)	–	–	QDX0	PUART_RX	SPI_2: SPI_CS (slave)
P3	–	–	SPI_2: SPI_CLK (master)	–	QDX1	PUART_CTS	SPI_2: SPI_CLK (slave)
P4	IR_TX	–	SPI_2: MOSI (master)	–	QDY0	PUART_RX	SPI_2: MOSI (slave)
P8/ P33 ^a	– ACLK1	~TX_PD –	–	– SPI_2: MOSI (slave)	ADC_IN27 ADC_IN6	– QDX1	– PUART_RX
P9	–	TX_PD	–	–	ADC_IN26	–	–
P10/ P11/ P27/xtal32i ^b	– – –	PA_RAMP – QOC1	– – SPI_2: MOSI (master)	– – SPI_2: MOSI (slave)	ADC_IN25 ADC_IN24 –	– – –	– – –
P12/ P26 ^c	– –	– QOC0	–	– SPI_2: SPI_CS (slave)	ADC_IN23 SPI_1: MISO (master)	–	–
P13/ P28 ^d	– –	PWM3 QOC2	–	–	ADC_IN22 ADC_IN11	–	–
P14/ P38	– IR_TX	PWM2 –	– SPI_2: MOSI (master)	– SPI_2: MOSI (slave)	ADC_IN21 ADC_IN1	–	–
P15	–	SWDIO	–	IR_RX/ 60 Hz_main	ADC_IN20	SWDIO	–
P24	–	PUART_TX	–	SPI_2: SPI_CLK (slave)	SPI_1: MISO	–	–
P25	–	SPI_2: MISO (slave)	–	PUART_RX	SPI_2: MISO (master)	–	–
P32	ACLK0	PUART_TX	–	SPI_2: SPI_CS (slave)	ADC_IN7	QDX0	SPI_1: MISO

a. If dual-bonded, then use one of P8 or P33.

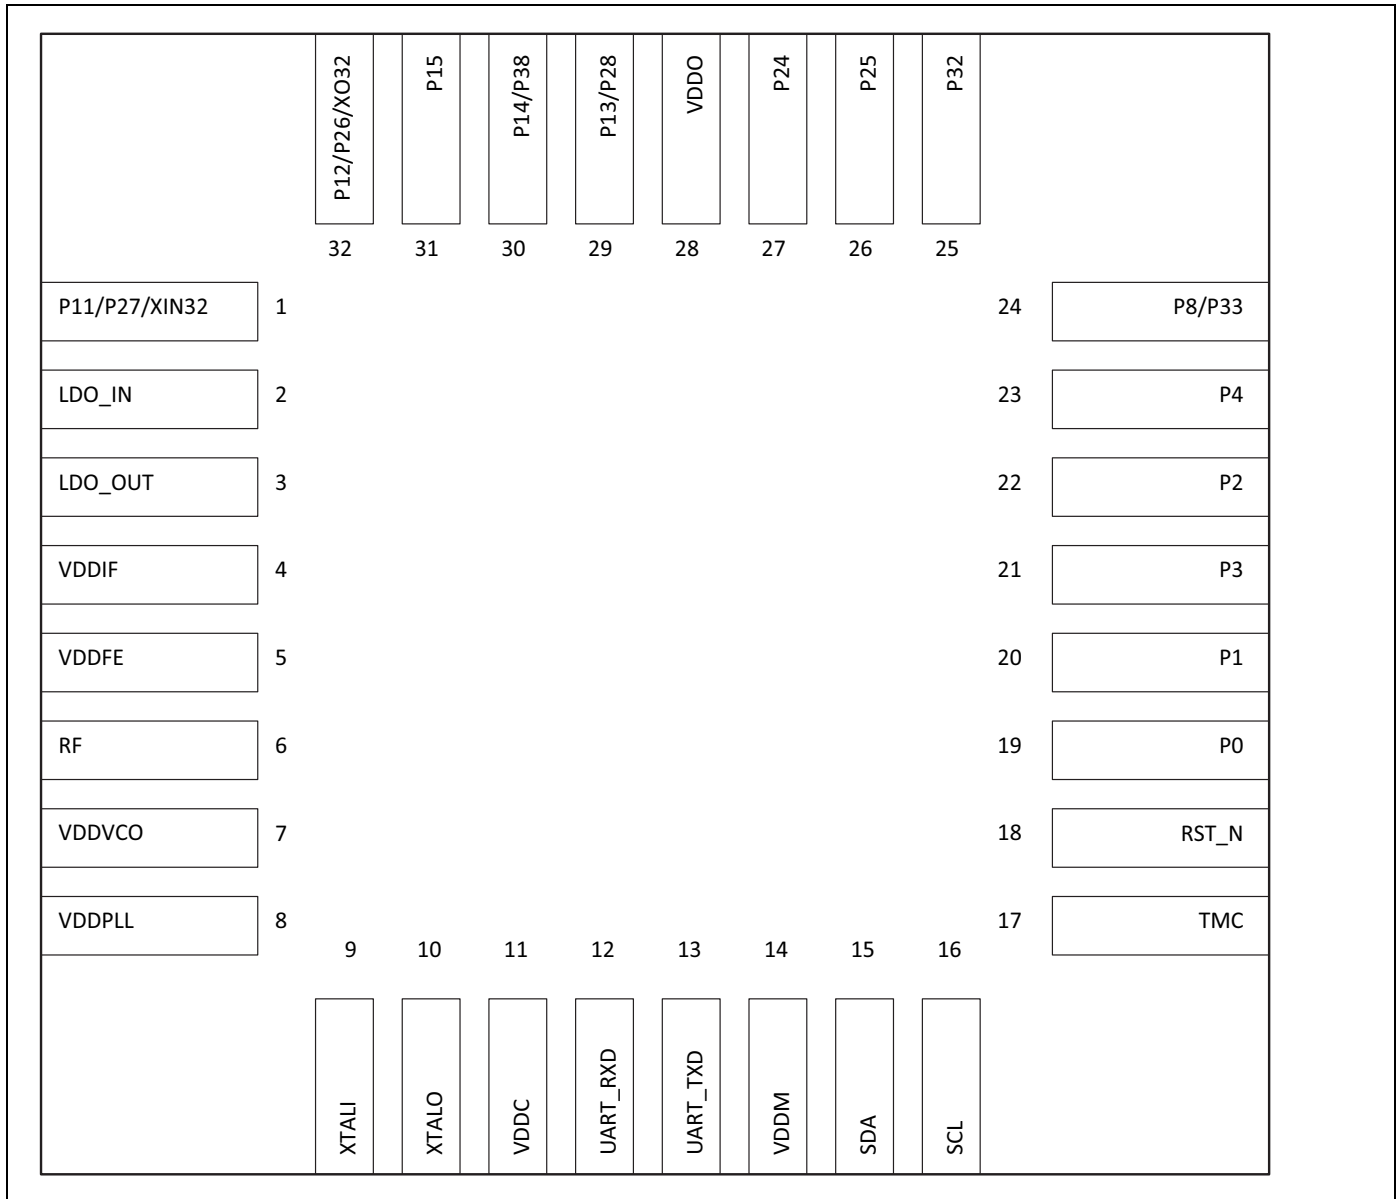

b. If quad-bonded, then use only one of P10, P11, or P27. P27 can source/sink 16 mA.

c. If dual-bonded, then use one of P12 or P26. P27 can source/sink 16 mA.

d. If dual-bonded, use one of P13 or P28. P28 can source/sink 16 mA.

2.3 Ball Maps

Figure 9. 32-pin QFN Ball Map

3. Specifications

3.1 Electrical Characteristics

Table 11 shows the maximum electrical rating for voltages referenced to VDD pin.

Table 11. Maximum Electrical Rating

Rating	Symbol	Value	Unit
DC supply voltage for RF domain	–	1.4	V
DC supply voltage for core domain	–	1.4	V
DC supply voltage for VDDM domain (UART/I ² C)	–	3.8	V
DC supply voltage for VDDO domain	–	3.8	V
DC supply voltage for VR3V	–	3.8	V
DC supply voltage for VDDFE	–	1.4	V
Voltage on input or output pin	–	V _{SS} – 0.3 to V _{DD} + 0.3	V
Operating ambient temperature range	T _{opr}	–30 to +85	°C
Storage temperature range	T _{stg}	–40 to +125	°C

Table 12 shows the power supply characteristics for the range T_J = 0 to 125°C.

Table 12. Power Supply

Parameter	Minimum ^a	Typical	Maximum ^a	Unit
DC supply voltage for RF	1.14	1.2	1.26	V
DC supply voltage for Core	1.14	1.2	1.26	V
DC supply voltage for VDDM (UART/I ² C)	1.62	–	3.63	V
DC supply voltage for VDDO	1.62	–	3.63	V
DC supply voltage for LDOIN	1.425	–	3.63	V
DC supply voltage for VDDFE	1.14	1.2 ^b	1.26	V

a. Overall performance degrades beyond minimum and maximum supply voltages.

b. 1.2V for Class 2 output with internal VREG.

Table 13 shows the digital level characteristics for (V_{SS} = 0V).

Table 13. LDO Regulator Electrical Specifications

Parameter	Conditions	Min	Typ	Max	Unit
Input voltage range	–	1.425	–	3.63	V
Default output voltage	–	–	1.2	–	V
Output voltage	Range	0.8	–	1.4	V
	Step size	–	40 or 80	–	mV
	Accuracy at any step	–5	–	+5	%
Load current	–	–	–	30	mA
Line regulation	V _{in} from 1.425 to 3.63V, I _{load} = 30 mA	–0.2	–	0.2	%V _O /V
Load regulation	I _{load} from 1 μA to 30 mA, V _{in} = 3.3V, Bonding R = 0.3Ω	–	0.1	0.2	%V _O /mA
Quiescent current	No load @V _{in} = 3.3V *Current limit enabled	–	6	–	μA
Power-down current	V _{in} = 3.3V, worst@70°C	–	5	200	nA

Table 14 shows the specifications for the ADC characteristics.

Table 14. ADC Specifications

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
Number of Input channels	–	–	–	9	–	–
Channel switching rate	f_{ch}	–	–	–	133.33	kch/s
Input signal range	V_{inp}	–	0	–	3.63	V
Reference settling time	–	Changing refsel	7.5	–	–	μ s
Input resistance	R_{inp}	Effective, single ended	–	500	–	k Ω
Input capacitance	C_{inp}	–	–	–	5	pF
Conversion rate	f_C	–	5.859	–	187	kHz
Conversion time	T_C	–	5.35	–	170.7	μ s
Resolution	R	–	–	16	–	bits
Effective number of bits	–	In specified performance range	–	See Table 2	–	
Absolute voltage measurement error	–	Using on-chip ADC firmware driver	–	± 2	–	%
Current	I	$I_{avdd1p2} + I_{avdd3p3}$	–	–	1	mA
Power	P	–	–	1.5	–	mW
Leakage current	$I_{leakage}$	T = 25°C	–	–	100	nA
Power-up time	$T_{powerup}$	–	–	–	200	μ s
Integral nonlinearity ³	INL	In guaranteed performance range	–1	–	1	LSB ^a
Differential nonlinearity ^a	DNL	In guaranteed performance range	–1	–	1	LSB ^a

a. LSBs are expressed at the 10-bit level.

Table 15 shows the specifications for the digital voltage levels.

Table 15. Digital Levels^a

Characteristics	Symbol	Min	Typ	Max	Unit
Input low voltage	V_{IL}	–	–	0.4	V
Input high voltage	V_{IH}	$0.75 \times V_{DDO}$	–	–	V
Input low voltage (VDDO = 1.62V)	V_{IL}	–	–	0.4	V
Input high voltage (VDDO = 1.62V)	V_{IH}	1.2	–	–	V
Output low voltage ^b	V_{OL}	–	–	0.4	V
Output high voltage ^b	V_{OH}	$V_{DDO} - 0.4$	–	–	V
Input capacitance (VDDMEM domain)	C_{IN}	–	0.12	–	pF

a. This table is also applicable to VDDMEM domain.

b. At the specified drive current for the pad.

Table 16 shows the specifications for current consumption.

Table 16. Current Consumption ^a

Operational Mode	Conditions	Typ	Max	Unit
Receive	Receiver and baseband are both operating, 100% ON.	9.8	10.0	mA
Transmit	Transmitter and baseband are both operating, 100% ON.	9.1	9.3	mA
Sleep	Internal LPO is in use.	12.0	13.0	μA
	–	0.65	–	

a. Currents measured between power terminals (Vdd) using 90% efficient DC-DC converter at 3V.

Table 17. Power Supply Current Consumption

Power Supply	Advertisement Rates	Typ	Max	Unit
VDDC	20 ms	1.96		mA
	100 ms			
	500 ms			
	1 s
