Precautions

★Please refer to "Basic Switches Common Precautions" for correct use.

Cautions

●Handling

Do not drop the Switch or apply strong shock. It may result in internal mechanism damages and may deteriorate the characteristics of the inner Reed Switch.

●Effect of the External Vibration

When a vibration of 1 kHz or higher is applied, note that false switching operations may occur due to resonant frequency, even with a low acceleration.

●Soldering

- Terminal connections

Complete the soldering at the iron tip temperature between 250 to 350°C (60W) within 5 seconds, and do not apply any external force for 1 minute after soldering.

Apply minimum amount of flux required. It may result in contact failure once the flux penetrates into the internal part of the Switch.

Correct Use

●Effect of the External Magnetic Fields

- If two or more switch units are closely installed, mutual interference due to the fringing field will occur, resulting in malfunction. Be sure to keep the gap between the switch units 8 mm or more.
- If you install the switch unit on the iron plate, each operating characteristic will change. Therefore, confirm that the interval between the switch units should be 2 mm or more.
- Do not use the switch in some area where a strong external magnetic field would be applied, otherwise malfunction will be caused.
- Use nonmagnetic brass or stainless steel (SUS304 alloy) screws for installation. Do not use any iron screw.
