Ordering Information

D75A-010.0M*, D75A-012.8M*, D75A-019.2M* or D75A-020.0M*

* For the tape and reel option, add -T to the end of the part number. Example: D75A-010.0M-T

Notes:

1. *Initial calibration @ 25°C. Specifications at time of shipment after 48 hours of operation.*
2. *Frequency stability vs. change in temperature. [±(Fmax - Fmin)/2.Fo].*
3. *Inclusive of frequency stability, supply voltage change (±1%), load change, aging, for 24 hours.*
4. *Frequency change after reciprocal temperature ramped over the operating range. Frequency measured before and after at 25°C.*
5. *Inclusive of calibration @ 25 C, frequency vs. change in temperature, change in supply voltage (±5%), load change (±5%), reflow soldering process and 20 years aging, referenced to Fo*
6. *BW = 12 KHz to 20 MHz.*
7. *Leave Pad 8 unconnected if enable / disable function is not required. When tri-stated, the output stage is disabled but the oscillator and compensation circuit are still active (current consumption < 1 mA).*
8. *For best performance it is recommended that the circuit connected to this output should have an equivalent input capacitance of 15pF.*

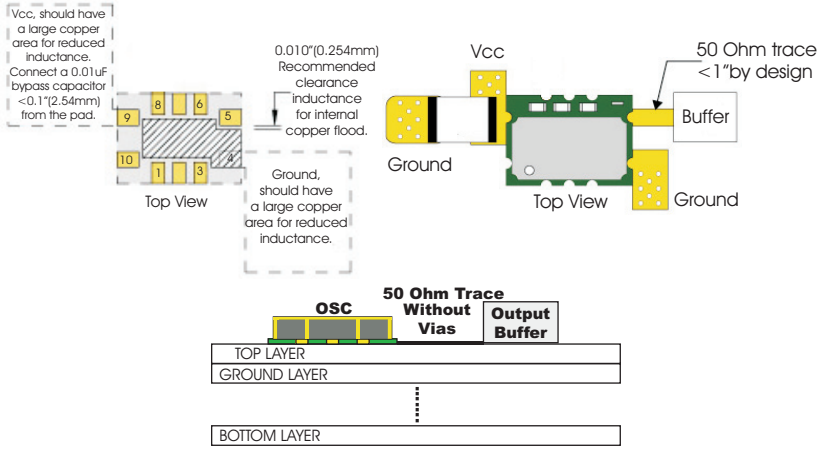
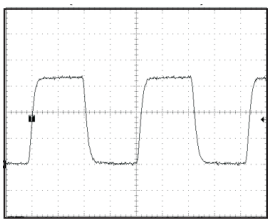
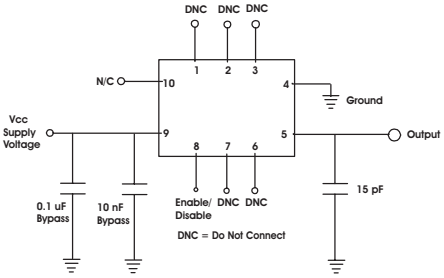
Design Recommendations



Output Waveform



Test Circuit



Attention: To achieve optimal frequency stability, and in some cases to meet the specification stated on this data sheet, it is required that the circuit connected to this TCXO output must have the equivalent input capacitance that is specified by the nominal load capacitance. Deviations from the nominal load capacitance will have a graduated effect on the stability of approximately 20 ppb per pF load difference.
