Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

DAC1405D750

Dual 14-bit DAC, up to 750 Msps; 4x and 8x interpolating

Rev. 06 — 2 July 2012 Product data sheet

1. General description

The DAC1405D750 is a high-speed 14-bit dual channel Digital-to-Analog Converter (DAC) with selectable 4× or 8× interpolating filters optimized for multi-carrier wireless transmitters.

Thanks to its digital on-chip modulation, the DAC1405D750 allows the complex I and Q inputs to be converted from BaseBand (BB) to IF. The mixing frequency is adjusted via a Serial Peripheral Interface (SPI) with a 32-bit Numerically Controlled Oscillator (NCO) and the phase is controlled by a 16-bit register.

Two modes of operation are available: separate data ports or a single interleaved high-speed data port. In the Interleaved mode, the input data stream is demultiplexed into its original I and Q data and then latched.

A 4× and 8× clock multiplier enables the DAC1405D750 to provide the appropriate internal clocks from the internal PLL. The internal PLL can be bypassed enabling the use of an external high frequency clock. The voltage regulator enables adjustment of the output full-scale current.

2. Features and benefits

- Dual 14-bit resolution
- 750 Msps maximum update rate
- Selectable 4× or 8× interpolation filters
- Input data rate up to 185 Msps
- Very low noise cap-free integrated PLL
- 32-bit programmable NCO frequency
- Dual port or Interleaved data modes
- 1.8 V and 3.3 V power supplies
- LVDS compatible clock
- Two's complement or binary offset data format
- 1.8 V/3.3 V CMOS input data buffers
- IMD3: 74 dBc; f_s = 737.28 Msps; f_o = 140 MHz
- ACPR: 72 dBc; 2-carrier WCDMA; f_s = 737.28 Msps; f_o = 153.6 MHz
- Typical 1.2 W power dissipation at 4× interpolation, PLL off and 740 Msps
- Power-down and Sleep modes
- Differential scalable output current from 1.6 mA to 22 mA
- On-chip 1.29 V reference
- External analog offset control (10-bit auxiliary DACs)
- Internal digital offset control
- Inverse x / (sin x) function
- Fully compatible SPI port
- Industrial temperature range from −40 °C to +85 °C

3. Applications

- Wireless infrastructure: LTE, WiMAX, GSM, CDMA, WCDMA, TD-SCDMA
- Communication: LMDS/MMDS, point-to-point
- Direct Digital Synthesis (DDS)
- Broadband wireless systems
- Digital radio links
- Instrumentation
- Automated Test Equipment (ATE)

4. Ordering information

		f_o = 153.6 MHz; 0 dBFS;	C	-	−156	-	dBFS/Hz
		f_o = 153.6 MHz; −10 dBFS	C	-	−158	-	dBFS/Hz

[1] D = guaranteed by design; C = guaranteed by characterization; I = 100 % industrially tested.

[2] CLKP and CLKN inputs are at differential LVDS levels. An external differential resistor with a value of between 80 Ω and 120 Ω should be connected across the pins (see Figure 8).

[3] $|V_{gpd}|$ represents the ground potential difference voltage. This is the voltage that results from current flowing through the finite resistance and the inductance between the receiver and the driver circuit ground voltages.

[4] IMD3 rejection with −6 dBFS/tone.

10. Application information

10.1 General description

The DAC1405D750 is a dual 14-bit DAC which operates at up to 750 Msps. Each DAC consists of a segmented architecture, comprising a 6-bit thermometer sub-DAC and an 8-bit binary weighted sub-DAC.

The input data rate of up to 185 MHz combined with the maximum output sampling rate of 750 Msps make the DAC1405D750 extremely flexible in wide bandwidth and multi-carrier systems. The device's quadrature modulator and 32-bit NCO simplifies system frequency selection. This is also possible because the 4× and 8× interpolation filters remove undesired images.

A SYNC signal is provided to synchronize data when the PLL is in the off state.

Two modes are available for the digital input. In Dual-port mode, each DAC uses its own data input line. In Interleaved mode, both DACs use the same data input line.

The on-chip PLL enables generation of the internal clock signals for the digital circuitry and the DAC from a low speed clock. The PLL can be bypassed enabling the use of an external, high-speed clock.

Each DAC generates two complementary current outputs on pins IOUTAP/IOUTAN and IOUTBP/IOUTBN. This provides a full-scale output current ($I_{O(fs)}$) up to 22 mA. An internal reference is available for the reference current which is externally adjustable using pin VIRES.

There are also some embedded features to provide an analog offset correction (auxiliary DACs) and digital offset control as well as for gain adjustment. All the functions can be set using the SPI.

The DAC1405D750 operates at both 3.3 V and 1.8 V each of which has separate digital and analog power supplies. The digital input is 1.8 V and 3.3 V compliant and the clock input is LVDS compliant.

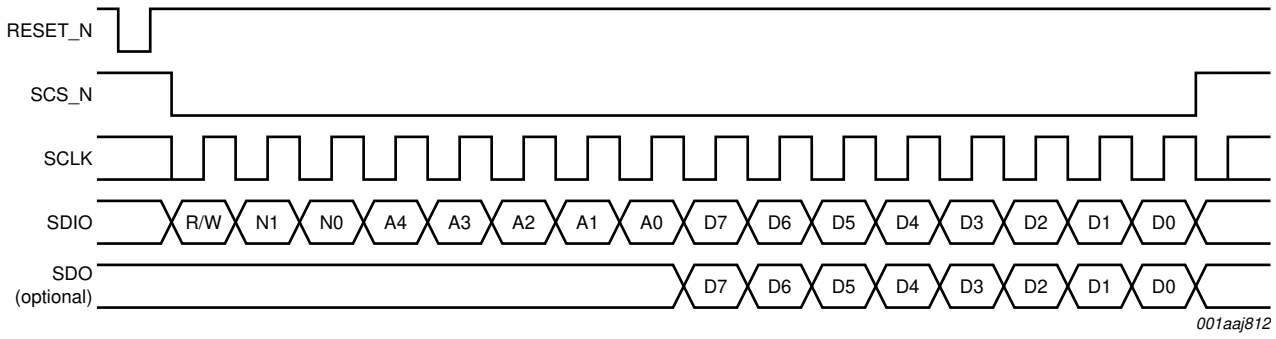
10.2 Serial peripheral interface

10.2.1 Protocol description

The DAC1405D750 Serial Peripheral Interface (SPI) is a synchronous serial communication port allowing easy interfacing with many industry microprocessors. It provides access to the registers that define the operating modes of the chip in both write and read modes.

This interface can be configured as a 3-wire type (SDIO as a bidirectional pin) or a 4-wire type (SDIO and SDO as unidirectional pins, input and output port respectively). In both configurations, SCLK acts as the serial clock and SCS_N acts as the serial chip select bar. If several DAC1405D750 devices are connected to an application on the same SPI-bus, only a 3-wire type can be used.

Each read/write operation is sequenced by the SCS_N signal and enabled by a LOW assertion to drive the chip with 1 to 4 bytes, depending on the content of the instruction byte (see Table 7).



R/W indicates the mode access, (see Table 6)

Fig 3. SPI protocol

Table 6. Read or Write mode access description

R/W	Description
0	Write mode operation
1	Read mode operation

In Table 7 N1 and N0 indicate the number of bytes transferred after the instruction byte.

Table 7. Number of bytes transferred

N1	N0	Number of bytes
0	0	1 byte transferred
0	1	2 bytes transferred
1	0	3 bytes transferred
1	1	4 bytes transferred

A0 to A4: indicate which register is being addressed. In the case of a multiple transfer, this address concerns the first register after which the next registers follow directly in a decreasing order according to Table 9 “Register allocation map”.

10.2.2 SPI timing description

The interface can operate at a frequency of up to 15 MHz. The SPI timing is shown in Figure 4.

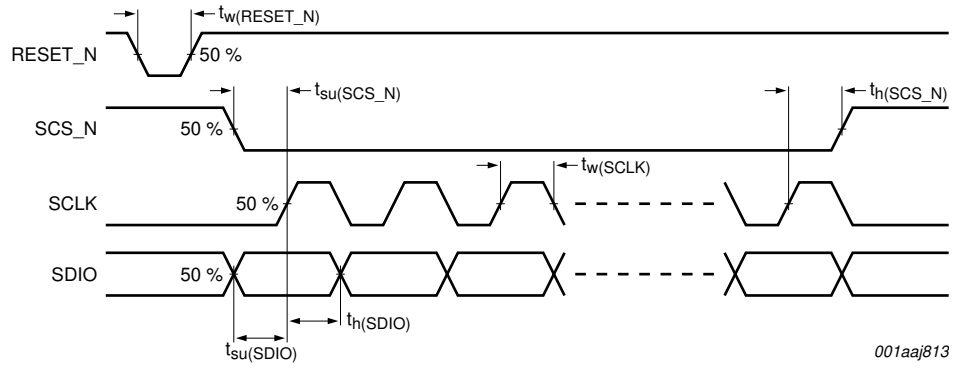


Fig 4. SPI timing diagram

The SPI timing characteristics are given in Table 8.

Table 8. SPI timing characteristics

Symbol	Parameter	Min	Typ	Max	Unit
f_{SCLK}	SCLK frequency	-	-	15	MHz
$t_{w(SCLK)}$	SCLK pulse width	30	-	-	ns
$t_{su(SCS\_N)}$	SCS_N set-up time	20	-	-	ns
$t_{h(SCS\_N)}$	SCS_N hold time	20	-	-	ns
$t_{su(SDIO)}$	SDIO set-up time	10	-	-	ns
$t_{h(SDIO)}$	SDIO hold time	5	-	-	ns
$t_{w(RESET\_N)}$	RESET_N pulse width	30	-	-	ns

10.2.3 Detailed descriptions of registers

An overview of the details for all registers is provided in Table 9.

Table 9. Register allocation map

Address		Register name	R/W	Bit definition								Default		
Dec	Hex			Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Bin	Dec	Hex
0	00h	COMMon	R/W	3W_SPI	SPI_RST	CLK_SEL	-	MODE_SEL	CODING	IC_PD	GAP_PD	10000000	128	80

10.2.4 Detailed register descriptions

Please refer to Table 9 for the register overview and relevant default values. In the following tables, all the values shown in bold are the default values.

Table 10. COMMon register (address 00h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	3W_SPI	R/W		serial interface bus type
			0	4 wire SPI
			1	**3 wire SPI**
6	SPI_RST	R/W		serial interface reset
			0	**no reset**
			1	performs a reset on all registers except 00h
5	CLK_SEL	R/W		data input latch
			0	**at CLK rising edge**
			1	at CLK falling edge
4	-	-	-	reserved
3	MODE_SEL	R/W		input data mode
			0	**dual port**
			1	interleaved
2	CODING	R/W		coding
			0	**binary**
			1	two's compliment
1	IC_PD	R/W		power-down
			0	**disabled**
			1	all circuits (digital and analog, except SPI) are switched off
0	GAP_PD	R/W		internal bandgap power-down
			0	**power-down disabled**
			1	internal bandgap references are switched off

Table 11. TXCFG register (address 01h) bit description
Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	NCO_ON	R/W		NCO
			0	disabled (the NCO phase is reset to 0)
			1	**enabled**
6	NCO_LP_SEL	R/W		low-power NCO
			0	**disabled**
			1	NCO frequency and phase given by the five MSBs of the registers 06h and 08h respectively
5	INV_SIN_SEL	R/W		x / (sin x) function
			0	**disabled**
			1	enabled

Table 11. TXCFG register (address 01h) bit description *…continued*

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
4 to 2	MODULATION[2:0]	R/W		modulation
			000	dual DAC: no modulation
			001	**positive upper single sideband up-conversion**
			010	positive lower single sideband up-conversion
			011	negative upper single sideband up-conversion
			100	negative lower single sideband up-conversion
1 to 0	INTERPOLATION[1:0]	R/W		interpolation
			01	reserved
			10	4×
			11	**8×**

Table 12. PLLCFG register (address 02h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description	
				PLL ON	PLL OFF
7	PLL_PD	R/W		PLL	
			0	**switched on**	
			1	switched off	
6	-	-	reserved		
5	PLL_DIV_PD	R/W		PLL divider	undefined
			0	**switched on**	**X**
			1	switched off	X
4 to 3	PLL_DIV[1:0]	R/W		PLL divider factor	Digital clock delay
			00	2	130 ps
			01	4	280 ps
			10	**8**	**430 ps**
			11	X	580 ps
2 to 1	DAC_CLK_DELAY[1:0]	R/W		phase shift (f_s)	undefined
			00	**0°**	**X**
			01	120°	X
			10	240°	X
0	DAC_CLK_POL	R/W		clock edge of DAC (f_s)	undefined
			0	**normal**	**X**
			1	inverted	X

Table 13. FREQNCO_LSB register (address 03h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	FREQ_NCO[7:0]	R/W	-	lower 8 bits for the NCO frequency setting

Table 14. FREQNCO_LISB register (address 04h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	FREQ_NCO[15:8]	R/W	-	lower intermediate 8 bits for the NCO frequency setting

Table 15. FREQNCO_UISB register (address 05h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	FREQ_NCO[23:16]	R/W	-	upper intermediate 8 bits for the NCO frequency setting

Table 16. FREQNCO_MSB register (address 06h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	FREQ_NCO[31:24]	R/W	-	most significant 8 bits for the NCO frequency setting

Table 17. PHINCO_LSB register (address 07h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	PH_NCO[7:0]	R/W	-	lower 8 bits for the NCO phase setting

Table 18. PHINCO_MSB register (address 08h) bit description

Bit	Symbol	Access	Value	Description
7 to 0	PH_NCO[15:8]	R/W	-	most significant 8 bits for the NCO phase setting

Table 19. DAC_A_Cfg_1 register (address 09h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	DAC_A_PD	R/W		DAC A power
			0	**on**
			1	off
6	DAC_A_SLEEP	R/W		DAC A Sleep mode
			0	**disabled**
			1	enabled
5 to 0	DAC_A_OFFSET[5:0]	R/W	-	lower 6 bits for the DAC A offset

Table 20. DAC_A_Cfg_2 register (address 0Ah) bit description

Bit	Symbol	Access	Value	Description
7 to 6	DAC_A_GAIN_COARSE[1:0]	R/W	-	lower 2 bits for the DAC A gain setting for coarse adjustment
5 to 0	DAC_A_GAIN_FINE[5:0]	R/W	-	lower 6 bits for the DAC A gain setting for fine adjustment

Table 21. DAC_A_Cfg_3 register (address 0Bh) bit description

Bit	Symbol	Access	Value	Description
7 to 6	DAC_A_GAIN_ COARSE[3:2]	R/W	-	most significant 2 bits for the DAC A gain setting for coarse adjustment
5 to 0	DAC_A_ OFFSET[11:6]	R/W	-	most significant 6 bits for the DAC A offset

Table 22. DAC_B_Cfg_1 register (address 0Ch) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	DAC_B_PD	R/W		DAC B power
			0	**on**
			1	off
6	DAC_B_SLEEP	R/W		DAC B Sleep mode
			0	**disabled**
			1	enabled
5 to 0	DAC_B_OFFSET[5:0]	R/W	-	lower 6 bits for the DAC B offset

Table 23. DAC_B_Cfg_2 register (address 0Dh) bit description

Bit	Symbol	Access	Value	Description
7 to 6	DAC_B_GAIN_ COARSE[1:0]	R/W	-	less significant 2 bits for the DAC B gain setting for coarse adjustment
5 to 0	DAC_B_GAIN_ FINE[5:0]	R/W	-	the 6 bits for the DAC B gain setting for fine adjustment

Table 24. DAC_B_Cfg_3 register (address 0Eh) bit description

Bit	Symbol	Access	Value	Description
7 to 6	DAC_B_GAIN_ COARSE[3:2]	R/W	-	most significant 2 bits for the DAC B gain setting for coarse adjustment
5 to 0	DAC_B_ OFFSET[11:6]	R/W	-	most significant 6 bits for the DAC B offset

Table 25. DAC_Cfg register (address 0Fh) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7 to 2	-	-	-	reserved
1	MINUS_3DB	R/W		NCO gain
			0	**unity**
			1	−3 dB
0	NOISE_SHPER	R/W		noise shaper
			0	**disabled**
			1	enabled

Table 26. SYNC_Cfg register (address 10h) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	SYNC_DIV	R/W		f_s divided by
			0	**4**
			1	8
6	SYNC_SEL	R/W		SYNC selection
			0	**disabled**
			1	enabled
5 to 0	-	-	-	reserved

Table 27. DAC_A_Aux_MSB register (address 1Ah) bit description

Bit	Symbol	Access	Value	Description
7 to 0	AUX_A[9:2]	R/W	-	most significant 8 bits for the auxiliary DAC A

Table 28. DAC_A_Aux_LSB register (address 1Bh) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	AUX_A_PD	R/W		auxiliary DAC A power
			0	**on**
			1	off
6 to 1	-	-	-	reserved
1 to 0	AUX_A[1:0]	R/W		lower 2 bits for the auxiliary DAC A

Table 29. DAC_B_Aux_MSB register (address 1Ch) bit description

Bit	Symbol	Access	Value	Description
7 to 0	AUX_B[9:2]	R/W	-	most significant 8 bits for the auxiliary DAC B

Table 30. DAC_B_Aux_LSB register (address 1Dh) bit description

Default settings are shown highlighted.

Bit	Symbol	Access	Value	Description
7	AUX_B_PD	R/W		auxiliary DAC B power
			0	**on**
			1	off
6 to 1	-	-	-	reserved
1 to 0	AUX_B[1:0]	R/W		lower 2-bits for the auxiliary DAC B

10.2.5 Recommended configuration

It is recommended that the following additional settings are used to obtain optimum performance at up to 750 Msps.

Table 31. Recommended configuration

Address		Value		
Dec	**Hex**	**Bin**	**Dec**	**Hex**
17	11h	00001010	10	0Ah
19	13h	01101100	**108**	6Ch
20	14h	01101100	108	6Ch

10.3 Input data

The setting applied to MODE_SEL (register 00h[3]; see Table 10 on page 17) defines whether the DAC1405D750 operates in the Dual-port mode or in Interleaved mode (see Table 32).

Table 32. Mode selection

Bit 3 setting	Function	I13 to I0	Q13 to Q0	Pin 41
0	Dual port mode	active	active	Q13
1	Interleaved mode	active	off	SELIQ

10.3.1 Dual-port mode

The data input for Dual-port mode operation is shown in Figure 5 “Dual-port mode”. Each DAC has its own independent data input. The data enters the input latch on the rising edge of the internal clock signal and is transferred to the DAC latch.

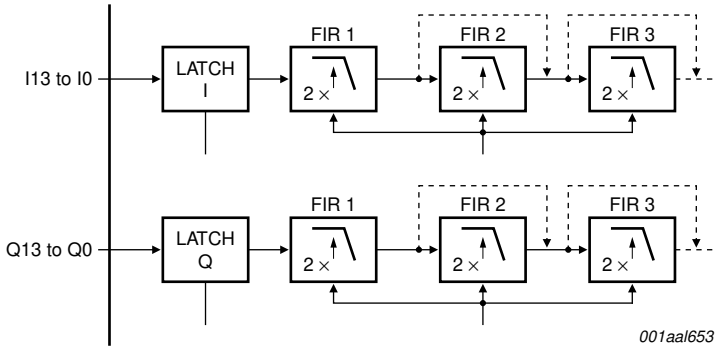

Fig 5. Dual-port mode

10.3.2 Interleaved mode

The data input for the Interleaved mode operation is illustrated in Figure 6.

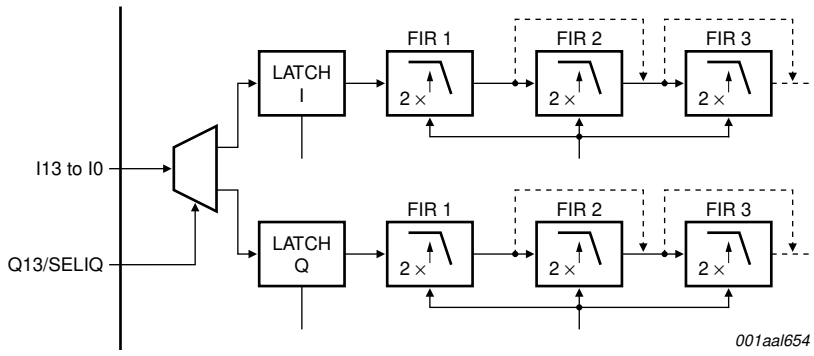

Fig 6. Interleaved mode operation

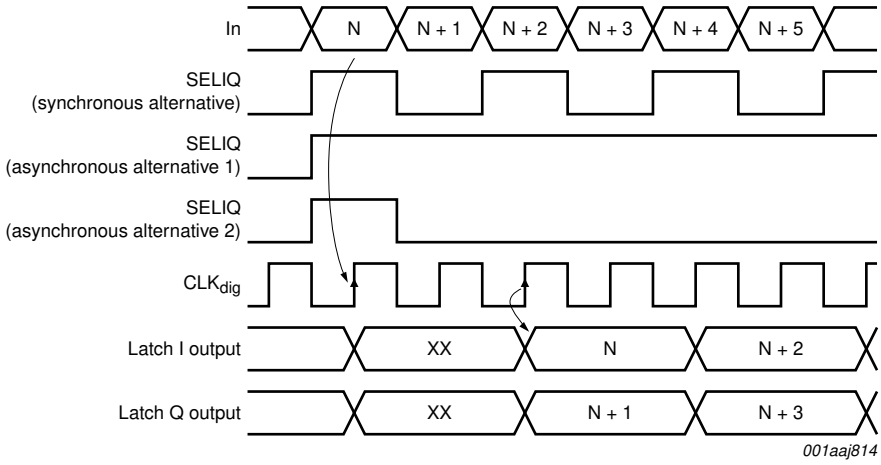
In Interleaved mode, both DACs use the same data input at twice the Dual-port mode frequency. Data enters the latch on the rising edge of the internal clock signal. The data is sent to either latch I or latch Q, depending on the SELIQ signal.

The SELIQ input (pin 41) allows the synchronization of the internally demultiplexed I and Q channels; see Figure 7.



CLK_{dig} = internal digital clock

Fig 7. Interleaved mode timing (8x interpolation, latch on rising edge)

The SELIQ signal can be either synchronous or asynchronous (single rising edge, single pulse). The first data following the SELIQ rising edge is sent in channel I and following data is sent in channel Q. After this, data is distributed alternately between these channels.

10.4 Input clock

The DAC1405D750 can operate at the following clock frequencies:

PLL on: up to 185 MHz in Dual-port mode and up to 370 MHz in Interleaved mode

PLL off: up to 750 MHz

The input clock is LVDS compliant (see Figure 8) but it can also be interfaced with CML differential sine wave signal (see Figure 9).

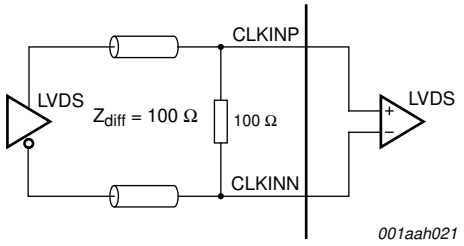


Fig 8. LVDS clock configuration

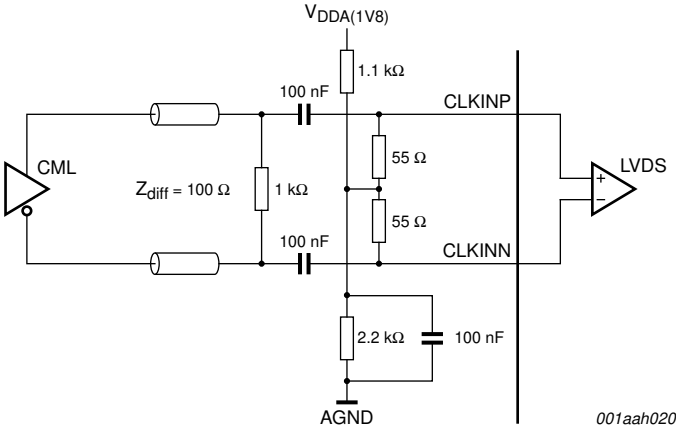

Fig 9. Interfacing CML to LVDS

10.5 Timing

The DAC1405D750 can operate at a sampling frequency (f_s) up to 750 Msps with an input data rate (f_{data}) up to 185 MHz. When using the internal PLL, the input data is referenced to the CLK signal. When the internal PLL is bypassed, the SYNC signal is used as a reference. The input timing in the second case is shown in Figure 10.

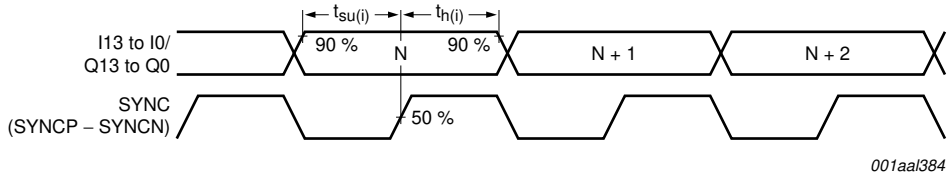

Fig 10. Input timing diagram when internal PLL bypassed (off)

10.5.1 Timing when using the internal PLL (PLL on)

In Table 33 the links between internal and external clocking are defined. The setting applied to PLL_DIV[1:0] (register 02h[4:3]; see Table 9 “Register allocation map”) allows the frequency between the digital part and the DAC core to be adjusted.

Table 33. Frequencies

Mode	CLK input (MHz)	Input data rate (MHz)	Interpolation	Update rate (Msps)	PLL_DIV[1:0]
Dual Port	185	185	4×	740	01 (/ 4)
Dual Port	92.5	92.5	8×	740	10 (/ 8)
Interleaved	370	370	4×	740	00 (/ 2)
Interleaved	185	185	8×	740	01 (/ 4)

The settings applied to DAC_CLK_DELAY[1:0] (register 02h[2:1]) and DAC_CLK_POL (register 02h[0]), allow adjustment of the phase and polarity of the sampling clock. This occurs at the input of the DAC core and depends mainly on the sampling frequency. Some examples are given in Table 34.

Table 34. Sample clock phase and polarity examples

Mode	Input data rate (MHz)	Interpolation	Update rate (Msps)	DAC_CLK_ DELAY [1:0]	DAC_CLK_ POL
Dual Port	92.5	4×	370	01	0
Dual Port	92.5	8×	740	01	0

10.5.2 Timing when using an external PLL (PLL off)

It is recommended that a delay of 280 ps is used on the internal digital clock (CLK_{dig}) to obtain optimum device performance up to750 Msps.

Table 35. Optimum external PLL timing settings

Address		Register name	Value			
Dec	Hex		Digital clock delay	Bin	Dec	Hex
2	02h	PLLCFG	280 ps	10001000	136	88h

10.6 FIR filters

The DAC1405D750 integrates three selectable Finite Impulse Response (FIR) filters which enables the device to use 4× or 8× interpolation rates. All three interpolation filters have a stop-band attenuation of at least 80 dBc and a pass-band ripple of less than 0.0005 dB. The coefficients of the interpolation filters are given in Table 36.
