Mode of Operation

The relay(s) operates as soon as the power supply is applied.

When the power supply is interrupted the time period starts and, at the expiration of the set time period, the relay releases.

If the power supply is reapplied before the relay released the time is reset and the relay remains ON.

The built-in battery (NiCd) will be charged while the power supply is applied.

Note:
DBB02 and PBB02 should not be operated by pulses shorter than 200 ms.
For these purposes the relays DMB01 or PMB01, operated by external contact function, should be used.

The battery test is performed on terminals + and A2 or 7 and 10.

It is recommended to connect DBB02 and PBB02 to the power supply for 42 h before it is put into regular service in order to compensate for energy losses due to, for example, a long storage period.

Range/Time Setting

Adjust the time range setting the DIP-switches 1 and 2 as shown below.
To access the DIP-switches open the plastic cover using a screwdriver as shown below.

Centre knob:
Time setting on relative scale: 1 to 10 with respect to the chosen range.

Operation Diagram

Curves

The tables indicate the charging time needed to keep the built-in battery fully charged for a certain adjusted time period.

Example
Adjusted time period 10h, battery charging time will be about 2.2 h.

At 5 operations: 5 x 10 h, battery charging will be 5 x 2,2 h. If the calculated charging time cannot be obtained, then the battery voltage has to be checked, as it must not drop below 4.2 VDC (min. battery voltage).

Test can be performed on terminals + and A2 or 7 and 10.
