

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

LTC2956 Wake-Up Timer with Pushbutton Control

DESCRIPTION

Demonstration circuits 2254A-A and 2254A-B feature the LTC2956-1 and LTC2956-2, respectively. The LTC[®]2956 is a micropower, wide input voltage range, configurable wake-up timer with pushbutton control. It periodically wakes up and turns on a connected system to perform tasks like monitoring temperature or capturing images. After completing the task, the LTC2956 turns the system off to conserve power. The wake-up timer period can be adjusted from 250ms to 39 days.

The DC2254A allows easy access to all the pins necessary to configure the device. Onboard jumpers, and an 8-pin DIP switch provide a range of value options, to set the wake-up timer, wake-up timer period and long power down time. Turrets are also present, allowing direct access to all the pins present on the LTC2956 to allow easy interfacing with a system with arbitrary requirements.

Design files for this circuit board are available at <http://www.linear.com/demo/DC2254A>

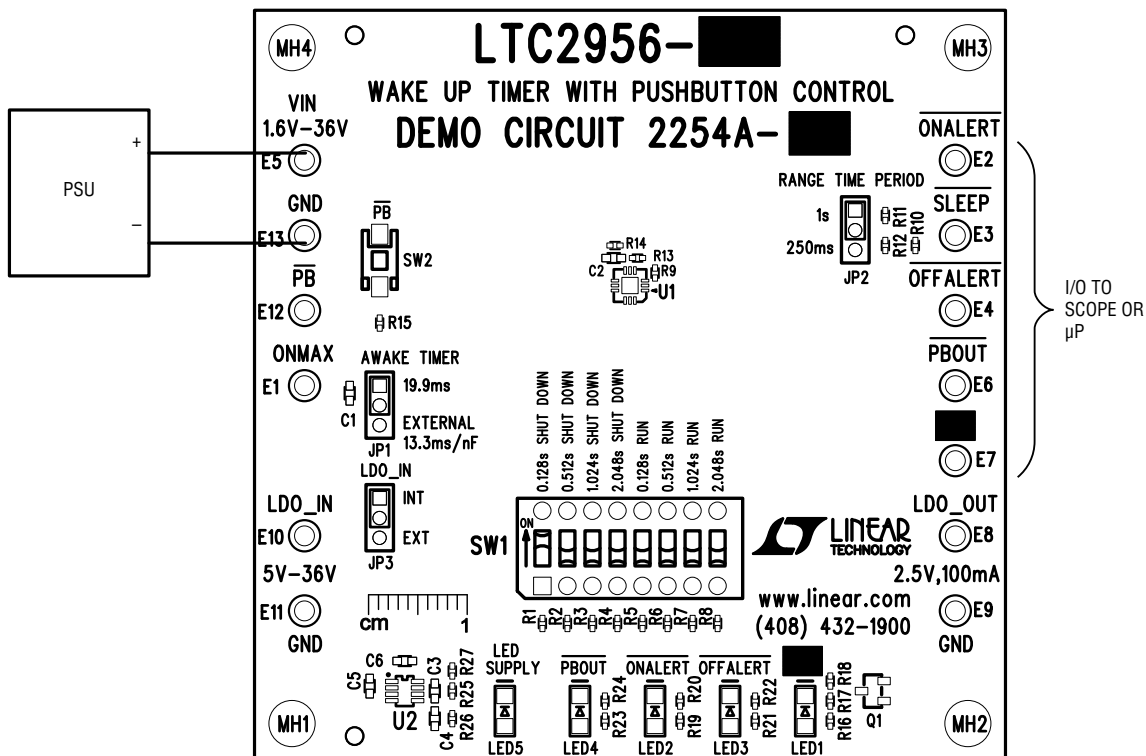

Figure 1. Test Equipment Setup

DC2254A TURRET AND JUMPER DEFINITIONS

JUMPER AND SWITCH SETTINGS

RANGE TIME PERIOD (JP2): Sets the time period between enable signal assertions. The two available options present on the board are 250ms and 1s. See Applications Information in the LTC2956 data sheet and replace R11 and/or R12 if another time is desired.

AWAKE TIMER (JP1): Sets the time the enable signal stays asserted. The onboard capacitor can be used for an awake time of 19.9ms or an external arbitrary capacitor can be used to set a user defined enable time. The maximum allowed awake time is set at 13.3ms/nF.

LDO_IN (JP3): Choose the input to the onboard LT3060 regulator. It can either be set to INT to have it connected to the VIN pin, or EXT in order to have it driven by the LDO_IN turret. See the Operating Principles section. Only for LED/Monitor circuitry.

SW1: This 8 pin DIP switch can be used to initialize the part in either RUN or SHUTDOWN mode and also allows configuration of the t_{LONG} time. See Applications Information in the LTC2956 data sheet for more information.

SW2: This pushbutton switch controls the input to the \overline{PB} pin. This is an active low input with a 900k Ω pull up to an internal 3.3V regulated supply. When the pushbutton is pressed, EN/ \overline{EN} pin gets asserted after an initial debounce time of 32ms.

EXTERNAL CONNECTIONS

Signal connections are made via the row of turret posts along the edges of the board.

GND: (3 Turrets) These turrets are connected directly to the ground planes.

VIN: Connect a 1.6V to 36V power supply to this turret.

ONMAX: Connect a capacitor from this turret to GND if an arbitrary awake time is desired. Use the relationship $t_{AWAKETIME} = 13.3ms/nF$. Set the AWAKE TIMER jumper to EXTERNAL if using this turret.

\overline{PB} : This turret is already driven by the pushbutton present on the demoboard, however if needed it can be driven by an external signal to simulate a pushbutton press.

LDO_IN: Can be used to provide the LT3060 with power when the LDO_IN jumper is set to EXT.

LDO_OUT: Output from the LT3060. The state of this turret can be monitored by the LED labelled "LED SUPPLY".

DIGITAL CONNECTIONS

EN/ \overline{EN} : Active high (LTC2956-1) or active low (LTC2956-2) signal. Should go active either with a debounced pushbutton press or after a valid time period set by the RANGE TIME PERIOD jumper.

$\overline{ONALERT}$: This turret pulls low whenever the part goes from SHUTDOWN mode to RUN mode. The signal stays low while the EN/ \overline{EN} pin is asserted and it can be used as an input to a system to request for initial boot up routine. This turret may be left open if unused.

$\overline{OFFALERT}$: This turret pulls low for 1 second whenever the part goes from RUN mode to SHUTDOWN mode. This pin can be connected to the interrupt input (with a pullup resistor to the system supply) of a system to alert the system before shutdown. This pin may be left open if unused.

\overline{SLEEP} : This turret is an input and is active during RUN mode. In the Awake state, a falling edge at the \overline{SLEEP} input will de-assert EN/ \overline{EN} and put the system into the Sleep state. If the \overline{SLEEP} input goes high during the Sleep state, the LTC2956 reenters the Awake state and re-asserts EN/ \overline{EN} to turn a system on. Holding this turret high for more than t_{LONG} (which is set by SW1) will force the LTC2956 into SHUTDOWN mode. See data sheet for more details.

\overline{PBOUT} : This turret follows the debounced \overline{PB} input. This turret may be left open if unused.

OPERATING PRINCIPLES

Connect a 1.6V to 36V power supply to VIN. If VIN is less than 5.5V then set the LDO_IN jumper to EXTERNAL and connect a 5.5V to 35V supply to the LDO_IN turret. The LTC2956 will still operate with no power applied to LDO_IN, but monitor LEDs will not function.

RUN AND SHUTDOWN MODE

The LTC2956 has two modes of operation: RUN mode and SHUTDOWN mode.

In RUN mode, the LTC2956 cycles between the Awake state and the Sleep state with a period of t_{PERIOD} which is set by the RANGE TIME PERIOD jumper. During the Awake state, the $\overline{EN/\overline{EN}}$ pin is asserted to turn the system on, and the t_{ONMAX} timer runs. The t_{ONMAX} timer can be configured with the AWAKE TIMER jumper. The LTC2956 exits the Awake state when a falling edge is detected on the SLEEP pin or if the t_{ONMAX} timer expires. In the Sleep state the $\overline{EN/\overline{EN}}$ output stays de-asserted. The LTC2956 only returns to the Awake state when the t_{PERIOD} time is reached, pushbutton is pressed or if a logic high is detected on the \overline{SLEEP} pin. The LTC2956 can be put into SHUTDOWN mode if the pushbutton is held low for longer than a user defined t_{LONG} period.

The SHUTDOWN mode is a very low power mode with the timer disabled, entered through a press of the pushbutton or a high pulse at the SLEEP input which lasts longer than t_{LONG} . A short press on the pushbutton brings the LTC2956 back into RUN mode.

On power up, the LTC2956 can be initialized to either of these two modes. SW1 provides 8 different options to initialize the part as shown in Table 1.

Table 1. SW1 Configuration Table

SW1 POSITION	MODE	TLONG
1	SHUTDOWN	0.128s
2	SHUTDOWN	0.512s
3	SHUTDOWN	1.024s
4	SHUTDOWN	2.048s
5	RUN	0.128s
6	RUN	0.512s
7	RUN	1.024s
8	RUN	2.048s

$\overline{ONALERT}$ AND $\overline{OFFALERT}$ SIGNALS

The $\overline{ONALERT}$ signal pulls low when the LTC2956 enters RUN mode from SHUTDOWN. This signal is useful to allow connected systems to run initialization tasks.

The $\overline{OFFALERT}$ signal pulls low when the LTC2956 enters SHUTDOWN mode from RUN mode. When the \overline{PB} pin is held low for a time longer than t_{LONG} during RUN mode, the LTC2956 first pulls the $\overline{OFFALERT}$ pin low which lasts for t_{OFF} (1s typ). Once the t_{OFF} timer completes, the LTC2956 transitions to the SHUTDOWN mode.

DEMO MANUAL DC2254A

DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following **AS IS** conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. **THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.**

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. **LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

LTC currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

Please read the DEMO BOARD manual prior to handling the product. Persons handling this product must have electronics training and observe good laboratory practice standards. **Common sense is encouraged.**

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
