

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

 - 4.2 Sample Code

Introduction

The DFRobot Relay shield V2.1 is capable of controlling 4 relays. The max switching power is DC 90W or AC 360VA. It is possible to control the Relay shield through Arduino/DFRduino using digital IOs with external 7 to 12V supply. With the built in xbee socket, it can be wirelessly controlled via Xbee/bluetooth/WPM. This makes it an ideal solution for automation and robotics.

Specification

- Compatible with Arduino Rev3
- 4 buttons to test module
- LED status indicator of relay
- Support Xbee IO directly control
- Xbee socket for wireless communication
- Selectable digital IO pin for control(Default digital 2,7,8,10)
- 6 channels Analog IO & 13 channels Digital IO
- Up to 4 Relay with photo-coupled circuit
- Relay information:
 - Contact Rating 3A AC 120V / DC 24V
 - Max Switching Voltage AC 240V / DC 60V
 - Max Switching Current 5A
 - Max Switching Power AC 360VA / DC 90W
 - Electrical Life (Min) 100,000 Operations
 - Mechanical Life (Min) 10,000,000 Operations
 - Safety Standard(relay) UL cUL TUV CQC
 - Coil Working Voltage 9VDC
 - Working temperature -30°C to +85°C
 - Working temperature 40% - 85%
- Size:95x65mm

PinOut

Instruction of Digital Pin State		
Pin	Pin State:HIGH	Pin State:LOW
Digital 2	NC1 is disconnected with COM1	NC1 is connected with COM1
	NO1 is connected with COM1	NO1 is disconnected with COM1
Digital 7	NC2 is disconnected with COM2	NC2 is connected with COM2
	NO2 is connected with COM2	NO2 is disconnected with COM2
Digital 8	NC3 is disconnected with COM3	NC3 is connected with COM3
	NO3 is connected with COM3	NO3 is disconnected with COM3

Digital 10 NC4 is disconnected with COM4 NC4 is connected with COM4

NO4 is connected with COM4	NO4 is disconnected with COM4
----------------------------	-------------------------------

Note: NC: Normally Closed; NO: Normally Open.

More details:

- **PROG SWITCH:**
 - PROG: When programming or download the code if you plug the Xbee/bluetooth on the module
 - RGN: Run the module after finishing downloading the code
- S1,S2,S3,S4: 4 Buttons to test the module that you needn't program,S1- S4 correspond to relay1-relay4
- **Servo Power Supply: Just can supply power to the digital IO pins.**
- 4 Digital IO selection headers for the Relays:
 - D2,D7,D8,D10: Default,connect to Arduino digital 2,7,8,10 to drive the relays
 - IO0,IO1,IO2,IO3:Connect to Xbee's IO pins
 - **You can connect the middle pin header after you unplug the jumper, to Arduino digital IO with jumper cables depend on your needed pin mapping to drive relays. For example, when you use the board with an Arduino Ethernet board. They will conflict the digital 10, so you should remove the jumper on D10, and connect the middle pin to other digital IO.**
- Xbee interface: The Xbee module supports Xbee radios, Bluetooth Bee, and the Wireless programming module. This gives the project a versatile wireless communications capability.

Tutorial

Connection Diagram

In this sample connection diagram it shows how LED can be controlled via relays, while this is a bit of overkill for controlling LEDs its only meant to be an example. These relays can be used to control lamps, or some other mid-voltage range appliances.

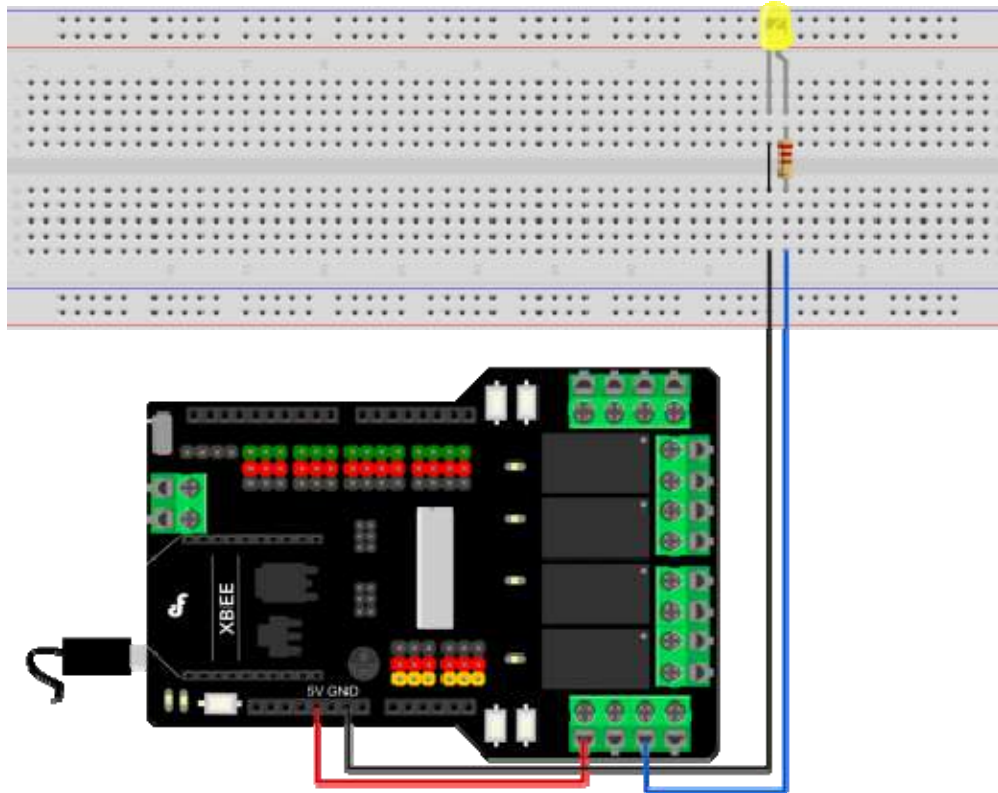

Figure1:Controlling LEDs with one relay

Plugging in an appliance

We will use "NO" for our example, using "NC" will simply reverse the logic, as explained above.

We recommend using a swappable cable to do this with, as using a relay requires you to perform some minor surgery on the appliance's cable. To plug in an appliance such as a lamp: Cut and strip a portion of the positive wire so that you end up with two ends of the wire as shown in Figure 2.

```
//D10 -> RELAY4

void setup(){
  for(int i = 0; i < 4; i++)  pinMode(relayPin[i],OUTPUT);
}

// an sample to switch the 4 relays

void loop(){

  int i;
  for(i = 0; i < 4; i++)  digitalWrite(relayPin[i],HIGH);
  delay(1000);
  for(i = 0; i < 4; i++)  digitalWrite(relayPin[i],LOW);
  delay(1000);

}
```

A more elaborate sample code

```
/*
# This Sample code is for testing the Relay shield V2.1 for Arduino.

# Editor : Phoebe
# Date   : 2013.2.28
# Ver    : 0.1
# Product: Relay shield for Arduino
# SKU    : DRI0144

# Hardwares:
1. Arduino UNO
2. Relay Shield For Arduino V2.1
3 Power Supply:7~ 12V
*/
```

```
case '2':
    Serial.println("Relay2");
    val=digitalRead(relayPin[1]);
    val=!val;
    digitalWrite(relayPin[1],val);
    break;
case '3':
    Serial.println("Relay3");
    val=digitalRead(relayPin[2]);
    val=!val;
    digitalWrite(relayPin[2],val);
    break;
case '4':
    Serial.println("Relay4");
    val=digitalRead(relayPin[3]);
    val=!val;
    digitalWrite(relayPin[3],val);
    break;

default:
    if(input != '\r' && input != '\n')
        Serial.println("invalid entry");
    break;
}
}
// else unablerelay();
}
}
```
