DM74ALS109A

Dual J-K Positive-Edge-Triggered Flip-Flop with Preset and Clear

General Description

The DM74ALS109A is a dual edge-triggered flip-flop. Each flip-flop has individual J, \bar{K} , clock, clear and preset inputs, and also complementary Q and \bar{Q} outputs.

Information at input J or \bar{K} is transferred to the Q output on the positive going edge of the clock pulse. Clock triggering occurs at a voltage level of the clock pulse and is not directly related to the transition time of the positive going pulse. When the clock input is at either the HIGH or LOW level, the J, K input signal has no effect.

Asynchronous preset and clear inputs will set or clear Q output respectively upon the application of low level signal.

The J- \bar{K} design allows operation as a D flip-flop by tying the J and \bar{K} inputs together.

Features

- Switching specifications at 50 pF
- Switching specifications guaranteed over full temperature and V_{CC} range
- Advanced oxide-isolated, ion-implanted Schottky TTL process
- Functionally and pin for pin compatible with Schottky and LS TTL counterpart
- Improved AC performance over LS109 at approximately half the power

X = Don't Care
↑ = Positive Edge Transition,
 Q_0 = Previous Condition of Q

Note 1: This condition is nonstable; it will not persist when present and clear inputs return to their inactive (HIGH) level. The output levels in this condition are not guaranteed to meet the V_{OH} specification.

Note 2: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
