

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

SFP and PON ONU Controller with Digital LDD Interface

General Description

The DS1886 controls and monitors all functions for SFF, SFP, and SFP+ modules including all SFF-8472 functionality for GPON/EPON and 10G PON ONU applications. The combination of the DS1886 with the MAX3710 supports all transmitter and receiver functionality. The DS1886 includes modulation current control and APC set-point control with tracking error adjustment. It continually monitors RSSI for LOS generation. A 13-bit analog-to-digital converter (ADC) monitors V_{CC} , temperature, laser bias, laser modulation, and receive power to meet all monitoring requirements. Receive power measurement is differential with support for common mode to V_{CC} . A 9-bit digital-to-analog converter (DAC) is included with temperature compensation for APD bias control.

Applications

SFF, SFP, and PON ONU Modules

[Ordering Information](#) appears at end of data sheet.

Features

- ◆ **Meets All SFF-8472 Control and Monitoring Requirements**
- ◆ **Companion Controller for the MAX3710 Laser Driver/Limiting Amplifier and MAX3945 Limiting Amplifier**
- ◆ **MAX3710/DS1886 Combination Supports Broad Spectrum of Continuous Mode and PON Applications Up to 2.5GHz**
- ◆ **Temperature Lookup Table (LUT) to Compensate for APC Tracking Error and Dual Closed-Loop Variables**
- ◆ **Three Laser Control Modes**
 - ◇ **Dual Closed Loop: Laser Bias and Laser Modulation Are Automatically Controlled with Multiple LUTs to Compensate Dual Closed-Loop Calibration Points**
 - ◇ **APC Loop: Laser Bias Automatically Controlled, Laser Modulation Controlled by Temperature LUT**
 - ◇ **Open Loop: Laser Bias and Laser Modulation Are Controlled by Temperature LUTs**
- ◆ **13-Bit ADC**
 - ◇ **Laser Bias, Laser Power, and Receive Power Support Internal and External Calibration**
 - ◇ **Differential Receive Power Input**
 - ◇ **Scalable Dynamic Range**
 - ◇ **Internal Direct-to-Digital Temperature Sensor**
 - ◇ **Alarm and Warning Flags for All Monitored Channels**
- ◆ **10-Bit DAC with Temperature Compensation for APD Bias**
- ◆ **Digital I/O Pins: Transmit Disable Input/Output, Rate Select Input, LOS Input/Output, Transmit Fault Input/Output, and IN1 Status Monitor and Fault input**
- ◆ **Comprehensive Fault Measurement System with Maskable Alarm/Warnings**
- ◆ **Flexible Password Scheme Provides Three Levels of Security**
- ◆ **256-Byte A0h and 128-Byte Upper A2h EEPROM**
- ◆ **I²C-Compatible Interface**
- ◆ **3-Wire Master to Communicate with the MAX3710/MAX3711 Laser Driver/Limiting Amplifier and MAX3945 Limiting Amplifier**

**SFP and PON ONU Controller
with Digital LDD Interface**

SFP and PON ONU Controller with Digital LDD Interface

ABSOLUTE MAXIMUM RATINGS

(All voltages relative to ground.)

Voltage Range on IN1, DAC, LOS, RSSIP, RSSIN,
REFIN, RSEL, TXF, TXMON, TXD..... -0.5V to ($V_{CC} + 0.5V$)
(subject to not exceeding +6V)

Voltage Range on V_{CC} , SDA, SCL, TXFOUT
and LOSOUT-0.5V to +6V

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)

TQFN (derate 28.6mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$).....2285.7mW

Operating Temperature Range..... -40°C to $+95^\circ\text{C}$

Programming Temperature Range 0°C to $+95^\circ\text{C}$

Storage Temperature Range..... -55°C to $+125^\circ\text{C}$

Lead Temperature (soldering, 10s) $+300^\circ\text{C}$

Soldering Temperature (reflow) $+260^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

($T_A = -40^\circ\text{C}$ to $+95^\circ\text{C}$, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Main Supply Voltage	V_{CC}	(Note 2)	2.97		3.63	V
High-Level Input Voltage (SDA, SCL, SDAOUT)	$V_{IH:1}$		0.7 x V_{CC}		$V_{CC} + 0.3$	V
Low-Level Input Voltage (SDA, SCL, SDAOUT)	$V_{IL:1}$		-0.3		+0.3 x V_{CC}	V
High-Level Input Voltage (IN1, LOS, RSEL, TXD, TXF)	$V_{IH:2}$		2.0		$V_{CC} + 0.3$	V
Low-Level Input Voltage (IN1, LOS, RSEL, TXD, TXF)	$V_{IL:2}$		-0.3		+0.8	V

DC ELECTRICAL CHARACTERISTICS

($V_{CC} = +2.97V$ to $+3.63V$, $T_A = -40^\circ\text{C}$ to $+95^\circ\text{C}$, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Current	I_{CC}	(Notes 2, 3)		0.7	2	mA
Output Leakage (LOSOUT, SDA, SDAOUT, TXFOUT)	I_{LO}				1	μA
Low-Level Output Voltage (CSEL1OUT, CSEL2OUT, LOSOUT, SDA, SDAOUT, SCLOUT, TXDOUT, TXFOUT)	V_{OL}	$I_{OL} = 4\text{mA}$			0.4	V
		$I_{OL} = 6\text{mA}$			0.6	
High-Level Output Voltage (CSEL1OUT, CSEL2OUT, SCLOUT, SDAOUT, TXDOUT)	V_{OH}	$I_{OH} = 4\text{mA}$	$V_{CC} - 0.4$			V
Input Leakage Current (IN1, LOS, RSEL, SCL, TXD, TXF)	I_{LI}				1	μA
Digital Power-On Reset	POD		1.6		2.6	V
Analogue Power-On Reset	POA	POA > POD by design	2.2		2.8	V

DS1886

SFP and PON ONU Controller with Digital LDD Interface

DAC ELECTRICAL CHARACTERISTICS

($V_{CC} = +2.97V$ to $+3.63V$, $T_A = -40^{\circ}C$ to $+95^{\circ}C$, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Delta-Sigma Input Clock Frequency	f_{DS}			2.1		MHz
Reference Voltage Input (REFIN)	V_{REFIN}	Minimum 0.1 μ F to GND	2		V_{CC}	V
Output Range			0		V_{REFIN}	V
Output Resolution		See the <i>Delta-Sigma Output and Reference</i> section for details (DAC FS[9:2] = FFh)			10	Bits
Output Impedance	R_{DS}	$V_{REFIN} = 2.5V$		45	100	Ω
Recovery After Power-Up	t_{INIT_DAC}	From $V_{CC} > V_{CC}$ LO alarm or warning				ms

ANALOG VOLTAGE MONITORING CHARACTERISTICS

($V_{CC} = +2.97V$ to $+3.63V$, $T_A = -40^{\circ}C$ to $+95^{\circ}C$, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
ADC Resolution		(Note 4)		13		Bits
INL		$T_A = +25^{\circ}C$	-3		+3	LSB
DNL			-1		+1	LSB
Update Rate for Temperature, TXMON (TXB/TXP), RSSIP-RSSIN, V_{CC}	t_{RR}	RSSIP-RSSIN requires only a coarse conversion (Note 5)		30		ms
Update Rate for RSSIP-RSSIN	$t_{R/R2}$	RSSIP-RSSIN requires a fine conversion		36		ms
Input/Supply Offset (TXMON, RSSIP, RSSIN, V_{CC})	V_{OS}	(Notes 5, 6)	-1	0	+1	LSB
Factory Setting Full Scale		TXMON and RSSIP-RSSIN coarse (Notes 6, 7)		2.5		V
		V_{CC} (Note 7)		6.5536		
		RSSIP-RSSIN fine (Note 7)		312.5		μ V
Temperature LSB Weighting				1/256		$^{\circ}C$

DIGITAL THERMOMETER CHARACTERISTICS

($V_{CC} = +2.97V$ to $+3.63V$, $T_A = -40^{\circ}C$ to $+95^{\circ}C$, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Thermometer Error	T_{ERR}	$-40^{\circ}C$ to $+95^{\circ}C$, guaranteed by design	-3		+3	$^{\circ}C$

DS1886

SFP and PON ONU Controller with Digital LDD Interface

AC ELECTRICAL CHARACTERISTICS

($V_{CC} = +2.97V$ to $+3.63V$, $T_A = -40^{\circ}C$ to $+95^{\circ}C$, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
TXD Rising Edge to Fault Clear	t_{OFF}	From \uparrow TXD (Notes 8, 9)			5	μs
TXD Falling Edge to TXDOUT Falling	t_{ON}	From \downarrow TXD (Note 10)			5	μs
Recovery After Power-Up: MAX3710	t_{INIT_3710}	From $\uparrow V_{CC} > POA$ (Note 11)		1		ms
Recovery After Power-Up: MAX3710 and MAX3945	t_{INIT_3945}	From $\uparrow V_{CC} > VCC$ LO alarm or warning (Note 12)		1		ms
Fault Assert Time (to TXFOUT = 1)	t_{INITR1}	From \downarrow TXD		30		ms
Fault Reset Time at Power-On (to TXFOUT = 0)	t_{INITR2}	From $\uparrow V_{CC} > POA$, Figure 12c (Note 13)		12.5		ms

STARTUP TIMING CHARACTERISTICS

($V_{CC} = +2.97V$ to $+3.63V$, $T_A = -40^{\circ}C$ to $+95^{\circ}C$, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Output Enable Time Following POA	t_{INIT}	(Notes 13, 14)		13		ms

3-WIRE DIGITAL INTERFACE SPECIFICATION

($V_{CC} = +2.97V$ to $+3.63V$, $T_A = -40^{\circ}C$ to $+95^{\circ}C$, unless otherwise noted. Timing is referenced to $V_{IL(MAX)}$ and $V_{IH(MIN)}$.) (Note 1)
(See [Figure 13](#).)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
SCLOUT Clock Frequency	f_{SCLOUT}			1.05		MHz
SCLOUT Duty Cycle	t_{3WDC}			50		%
SDAOUT Setup Time	t_{DS}			500		ns

NONVOLATILE MEMORY CHARACTERISTICS

(V_{CC} = +2.97V to +3.63V, unless otherwise noted.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
EEPROM Write Cycles		At T _A = +25°C	50,000			—
		At T _A = +85°C	10,000			

Note 1: Limits are production tested at T_A = +25°C. Limits over the operating temperature range and relevant supply voltage range are guaranteed by design and characterization. Typical values are not guaranteed.

Note 2: All voltages are referenced to ground. Current entering the IC is considered positive, and current exiting the IC is considered negative.

Note 3: Inputs are at supply rail. Outputs are not loaded. Does not include REFIN current. Measured using the [Typical Operating Circuit—GPON ONU](#).

Note 4: The ADC output is available internally as a 16-bit value. The 16 bits are derived by left-shifting the 13-bit ADC output by 3.

Note 5: Guaranteed by design.

Note 6: TXB (transmit bias) and TXP (transmit power) are separate ADC conversions that are performed on the same input pin, TXMON.

Note 7: Full scale is user-programmable.

Note 8: Time until faults are cleared (falling edge of TXFOUT).

Note 9: Time until rising edge of TXDOUT.

Note 10: Time until falling edge of TXDOUT.

Note 11: Time until completion of initial MAX3710 control registers configuration.

Note 12: Time until completion of initial MAX3945 and MAX3710 control registers configuration.

Note 13: V_{CC} LO alarm or warning is enabled, a V_{CC} conversion is completed, and V_{CC} is above V_{CC} LO alarm or warning. See [Figure 12c](#).

Note 14: DAC output valid, 3-wire writes from LUTs complete, and digital outputs valid.

Note 15: I²C interface timing shown is for fast-mode (400kHz) operation. This device is also backward compatible with I²C standard mode.

Note 16: C_B = Total capacitance of one bus line in pF.

Note 17: EEPROM write begins after a STOP condition occurs.

DS1886

SFP and PON ONU Controller with Digital LDD Interface

Detailed Description

The DS1886 integrates the control and monitoring functionality required to implement an SFP or PON ONU system using the Maxim MAX3710 or other compatible laser driver and limiting amplifier. Key components of the DS1886 are shown in the [Block Diagram](#) and described in subsequent sections.

Table 1. Acronyms

ACRONYM	DESCRIPTION
ADC	Analog-to-Digital Converter
APC	Automatic Power Control
APD	Avalanche Photodiode
DAC	Digital-to-Analog Converter
LOS	Loss of Signal
LUT	LUT
NV	Nonvolatile
QT	Quick Trip
ROSA	Receiver Optical Subassembly
SEE	Shadowed EEPROM

Monitors and Fault Detection

Monitors

The DS1886 monitors five ADC channels. This monitoring combined with the alarm enables (A2h Table 01h/05h) determines when/if the DS1886 turns off the MAX3710 DACs and triggers the TXFOUT and TXDOUT outputs. All the monitoring levels and interrupt masks are user-programmable. See [Figure 1a](#).

ACRONYM	DESCRIPTION
SFF	Small Form Factor
SFF-8472	Document Defining Register Map of SFPs and SFFs
SFP	Small Form-Factor Pluggable
SFP+	Enhanced SFP
TE	Tracking Error. Deviation from linear of the relationship between transmitted power and monitor diode current.
TIA	Transimpedance Amplifier
TOSA	Transmit Optical Subassembly
TXP	Transmit Power

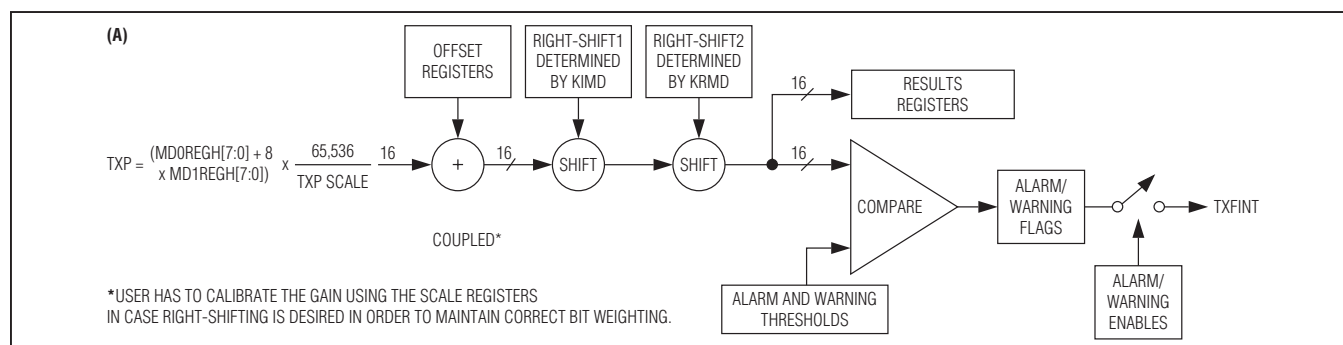

Figure 1a. ADC Channel Only for TXP when BURST_MODE = 1 in Table 02h, Register 89h

Figure 1b. ADC Channel

SFP and PON ONU Controller with Digital LDD Interface

ADC Monitors and Alarms

The ADC monitors temperature (internal temp sensor), V_{CC} , laser bias (TXB), laser power (TXP), and receive power (RSSIC for coarse, RSSIF for fine) using an analog multiplexer to measure them using a round-robin scheme with a single ADC (see the [ADC Timing](#) section). The voltage channels have a customer-programmable full-scale range and all channels have a customer-programmable offset value that is factory programmed to a default value ([Table 2](#)). Additionally, TXB, TXP, RSSIC, and RSSIF can right-shift results as described in the [Right-Shifting ADC Result](#) section. This allows customers with specified ADC ranges to calibrate the ADC input gain by a factor of 2^n to measure small signals (thereby reducing the full scale by a factor of 2^n). The DS1886 can then right-shift the results by n bits (effectively multiplying by a factor of $1/2^n$) to maintain the bit weight of their specification. See the [Right-Shifting ADC Result](#) and [Enhanced RSSI Monitoring \(Dual Range Functionality\)](#) sections for more information.

Alarms and Warnings

The ADC results (after right-shifting, if used) are compared to the alarm and warning thresholds after each conversion, and the corresponding alarms and/or warnings are set, which can be programmed to create the internal signal TXFINT. The status of TXFINT can be read in [A2h Lower Memory, Register 71h](#). TXFINT is one of the signals used to trigger TXFOUT. TXFOUT can be programmed to cause TXDOUT outputs. These ADC thresholds are user-programmable, as are the masking registers that can be used to prevent the alarms from triggering the TXFOUT and TXDOUT outputs.

ADC Timing

Five analog channels are digitized in a round-robin fashion in the order as shown in [Figure 2](#). RSSI is measured twice to obtain coarse and fine measurements (RSSIC and RSSIF, respectively). The total time required to convert all channels is t_{RR} (see the [Analog Voltage Monitoring Characteristics](#) table for details). After each TXMON conversion, a 3-wire communication is initiated to toggle the MON_SEL bit (bit 6 in the MAX3710's TXCTRL2 register, programmed through [A2h Table 02h, Register E5h](#), bit 6). This causes the laser driver to alternate sending laser bias (TXB) and laser power (TXP) signals to the DS1886's TXMON input.

The DS1886 has a burst mode option to allow internal calculation of TXP using the MD0 and MD1 register values read from the MAX3710 over the 3-wire interface. In this option, the sampled TXP value is ignored. The TXP value in this burst mode is calculated as follows:

$$TXP = \frac{(MD0\ REGH\ [7:0] + 8 \times MD1\ REGH\ [7:0]) \times 65536}{TXP\ Scale}$$

TXP is then right-shifted ([Figure 1a](#)).

RIGHT-SHIFT₁ is determined by KIMD[1:0], TXCTRL3[4:3] as follows:

KIMD[1:0] TXCTRL3[4:3]	NO. OF RIGHT-SHIFTS
00	2
01	1
10	0
11	0

Table 2. ADC Default Monitor Full-Scale Ranges

SIGNAL (UNITS)	+FS SIGNAL	+FS HEX	-FS SIGNAL	-FS HEX
Temperature (°C)	127.996	7FFFh	-128	8000h
V_{CC} (V)	6.5528	FFF8h	0	0000h
TXB, TXP, RSSIC, RSSIF (V)	2.4997	FFF8h	0	0000h

DS1886

SFP and PON ONU Controller with Digital LDD Interface

RIGHT-SHIFT₂ is determined by KRMD[1:0], TXCTRL3[2:1] as follows:

KRMD[1:0] TXCTRL3[4:3]	NO. OF RIGHT-SHIFTS
00	2
01	1
10	0
11	0

Right-Shifting ADC Result

The right-shift operation on the ADC result is carried out based on the contents of right-shift control registers (A2h Table 02h, Register 8Eh and A2h Table 02h, Register 8Fh) in EEPROM. TXB, TXP, RSSIC, and RSSIF have 3 bits allocated to set the number of right-shifts. The user

must calibrate the corresponding monitors to achieve the correct LSB weighting. Up to seven right-shift operations are allowed and are executed as a part of every conversion before the results are compared to the high and low alarm levels, or loaded into their corresponding measurement registers (Lower Memory, Registers 64h–69h). This is true during the setup of internal calibration as well as during subsequent data conversions.

In burst mode, right-shifting for TXP is determined by KIMD and KRMD.

Differential RSSI Input

The DS1886 offers a fully differential input for RSSI that enables high-side monitoring of RSSI, as shown in Figure 3. This reduces board complexity by eliminating the need for a high-side differential amplifier or a current mirror.

Figure 2. ADC Round-Robin Timing

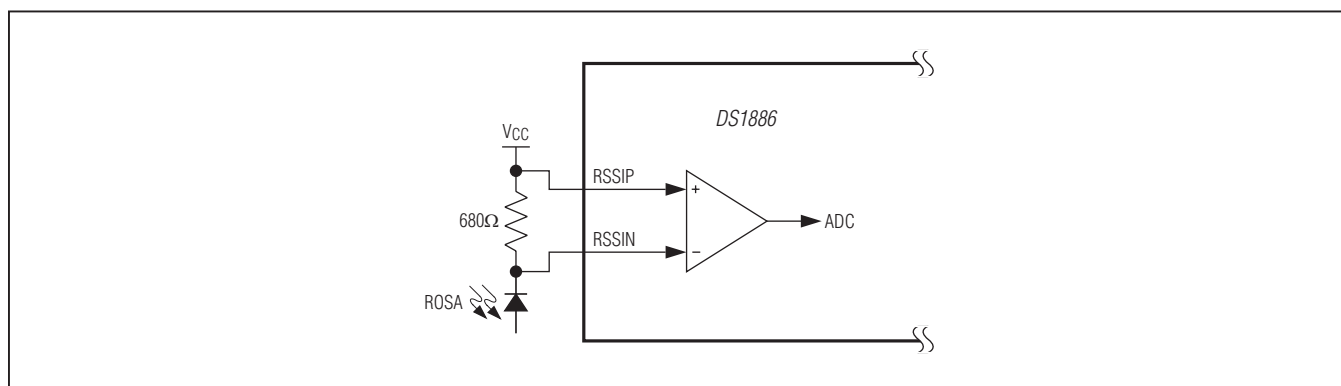

Figure 3. RSSI Differential Input for High-Side RSSI

SFP and PON ONU Controller with Digital LDD Interface

Laser Bias and Laser Power Through TXMON

The DS1886 measures both laser bias (TXB) and laser power (TXP) through the same input pin, TXMON. The DS1886 commands the MAX3710 laser driver to output the correct monitor signal before each ADC conversions takes place. [Figure 4](#) shows the two conversion paths. Each path has independent gain and offset calibration registers.

Enhanced RSSI Monitoring (Dual Range Functionality)

The DS1886 offers a feature to improve the accuracy and range of RSSI, which is most commonly used for monitoring RSSI. To achieve the SFF-8472 requirement of 0.1µW/LSB over -40 to 8.2dBm, the DS1886 makes two measurements to effectively achieve a 16-bit conversion with a 13-bit physical ADC. This “dual range” calibration can operate in two modes: APD mode and PIN mode.

APD Mode

For systems with a nonlinear relationship between the ADC input and desired ADC result, the mode should be set to APD mode ([Figure 5](#)). The RSSI measurement of an APD receiver is one such application. Using the APD mode allows a piece-wise linear approximation of the nonlinear response of the APD’s gain factor. The crossover point is the point between the fine and coarse points. The ADC result transitions between the fine and coarse ranges with no hysteresis. Right-shifting, slope adjustment, and offset are configurable for both the fine and coarse ranges. Two registers, XOVER FINE and XOVER COARSE, determine the crossover point. The XOVER FINE register ([A2h Table 02h, Register A0h–A1h](#)) determines the maximum results returned by fine ADC conversions, before right-shifting. The XOVER COARSE register ([A2h Table 02h, Register 90h–91h](#)) determines the minimum results returned by coarse ADC conversions, before right-shifting.

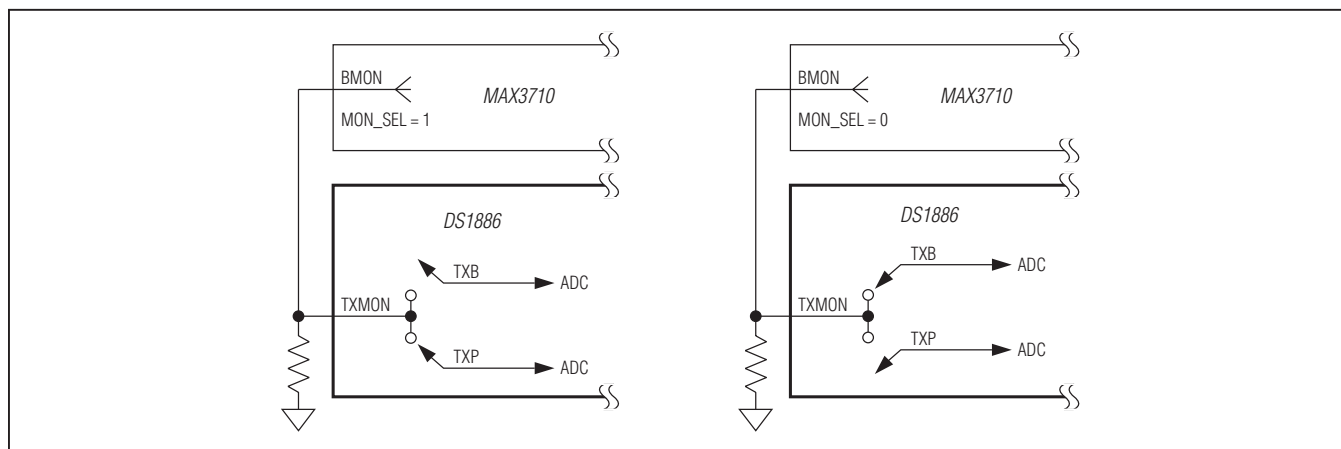

Figure 4. Laser Bias (TXB) and Laser Power (TXP) Monitoring Through TXMON

Figure 5. RSSI in APD Mode

SFP and PON ONU Controller with Digital LDD Interface

PIN Mode

The PIN mode is intended for systems with a linear relationship between the RSSI input and desired ADC result. The ADC result transitions between the fine and coarse ranges with hysteresis, as shown in Figure 6.

In PIN mode, the thresholds between coarse and fine mode are a function of the number of right-shifts being used. With the use of right-shifting, the fine mode full scale is programmed to $(1/2^{nth})$ of the coarse mode full scale. The DS1886 now auto ranges to choose the range that

gives the best resolution for the measurement. Table 3 shows the threshold values for each possible number of right-shifts.

Low-Voltage Operation

The DS1886 contains two power-on reset (POR) levels. The lower level is a digital POR (POD) and the higher level is an analog POR (POA). At startup, before the supply voltage rises above POA, the outputs are disabled, all SRAM locations are set to their defaults, shadowed EEPROM locations are zero, and all analog

SFP and PON ONU Controller with Digital LDD Interface

circuitry is disabled. When V_{CC} reaches POA, the SEE is recalled, and the analog circuitry is enabled. While V_{CC} remains above POA, the device is in its normal operating state, and it responds based on its nonvolatile configuration. If during operation V_{CC} falls below POA, but is still above POD, the SRAM retains the SEE settings from the first SEE recall, but the device analog is shut down and the outputs are disabled. If the supply voltage recovers back above POA, the device immediately resumes normal operation. If the supply voltage falls below POD, the device SRAM is placed in its default state and another SEE recall is required to reload the nonvolatile settings. The EEPROM recall occurs the next time V_{CC} next exceeds POA. [Figure 7](#) shows the sequence of events as the voltage varies.

Any time V_{CC} is above POD, the I²C interface can be used to determine if V_{CC} is below the POA level. This is accomplished by checking the RDYB bit in the STATUS byte ([A2h Lower Memory, Register 6Eh](#)). RDYB is set when V_{CC} is below POA; when V_{CC} rises above POA,

RDYB is timed (within 500 μ s) to go to 0, at which point the part is fully functional.

For all device addresses sourced from EEPROM ([A2h Table 02h, Register 8Ch](#)), the default DEVICE ADDRESS is A2h until V_{CC} exceeds POA, allowing the device address to be recalled from the EEPROM.

Power-On Analog (POA)

POA holds the DS1886 in reset until V_{CC} is at a suitable level ($V_{CC} > POA$) for the device to accurately measure with its ADC and compare analog signals with its quick-trip monitors. Because V_{CC} cannot be measured by the ADC when V_{CC} is less than POA, POA also asserts the VCC LO alarm, which is cleared by a V_{CC} ADC conversion greater than the customer-programmable V_{CC} low ADC limit. This allows a programmable limit to ensure that the head room requirements of the transceiver are satisfied during a slow power-up. The TXFOUT output does not latch until there is a conversion above the V_{CC} low limit. The POA alarm is nonmaskable. See the [Low-Voltage Operation](#) section for more information.

Figure 7. Low-Voltage Hysteresis Example

SFP and PON ONU Controller with Digital LDD Interface

Delta-Sigma Output and Reference

One delta-sigma output (DAC) is provided. This provides a 10-bit resolution output. The maximum voltage output is set by the input REFIN. An inexpensive shunt reference is recommended to generate the voltage applied to REFIN, as shown in [Figure 8](#). The output includes the ability to compensate the APD bias for temperature as given by the following formula:

$$\text{DAC_INT} = \text{TINDEX}[6:0] + \text{DAC OFFSET}$$

If $\text{INV_DAC} = 0$, then $\text{DAC}[9:0] = \text{DAC_INT}/\text{DACFS} \times V_{\text{REFIN}}$.

If $\text{INV_DAC} = 1$, then $\text{DAC}[9:0] = [3\text{FF} - (\text{DAC_INT}/\text{DACFS})] \times V_{\text{REFIN}}$.

where:

- 1) INV_DAC is at [A2h Table 02h, Register 8Dh](#), bit 7.
- 2) TINDEX is at [A2h Table 02h, Register 81h](#).
- 3) DAC OFFSET is an 8-bit value, representing the 8 MSBs of a 10-bit value. The two LSBs are 0.
- 4) DACFS ([A2h Table 02h, Register 88h](#)) is an 8-bit value, representing the 8 MSBs of a 10-bit value. The two LSBs are 0.
- 5) DAC is a 10-bit value.
- 6) The $\text{DAC}[9:0]$ is clamped at DACFS .
- 7) DAC_INT is an internal signal.

The delta-sigma output uses pulse-density modulation. It provides much lower output ripple than a standard

digital PWM output given the same clock rate and filter components. An RC filter is required on the DAC output as suggested in [Figure 8](#). The external RC filter components are chosen based on ripple requirements, output load, delta sigma frequency, and desired response time. Before t_{INIT} , the DAC output is high impedance.

The reference input, REFIN, is the supply voltage for the DAC's output buffer. The voltage source connected to REFIN must be able to support the edge rate requirements of the delta sigma outputs. In a typical application, a 0.1uF capacitor should be connected between REFIN and ground.

The DS1886's delta-sigma output is 10 bits. For illustrative purposes, a 3-bit example is provided in [Figure 9](#).

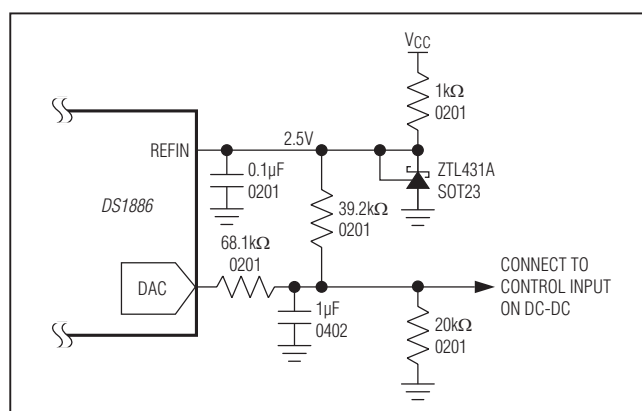

Figure 8. Recommended Shunt Reference and RC Filter for DAC Output

Figure 9. Delta-Sigma Output
