imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

embedded 4.3" TFT-DISPLAY 480x272 BUILT-IN INTELLIGENCE

capacitive touch panel: EA EDIPTETA3-ATC

FEATURES

- * POWER SUPPLY +5V / 180mA
- TFT GRAPHIC DISPLAY WITH BULIT-IN GRAPHIC FUNCTIONS
- * 480x272 DOTS, 16-BIT (65,536) COLORS WITH LED BACKLIGHT
- * LANDSCAPE AND PORTRAIT MODE (272x480) BY COMMAND
- * 4MB ON BOARD FLASH FOR FONTS, PICTURES, ANIMATIONS AND MACROS
- * 8 PRE-DEFINED FONTS, CAN BE EXPANDED
- * FONT ZOOM FROM 2mm TO about 80mm, TURNABLE IN 90° STEPS
- * 3 DIFFERENT INTERFACES ON BOARD: RS-232, I²C-BUS OR SPI-BUS
- * POSITIONING ACCURATE TO THE PIXEL WITH ALL FUNCTIONS
- * DRAW LINE, PLACE A DOT, AREA, BARGRAPH ...
- * PICTURES, ANIMATIONS; MIX TEXT AND GRAPHIC
- * MULTI-LINGUAL WITH MACRO PAGES
- * BACKLIGHT BRIGHTNESS BY SOFTWARE
- * ANALOGUE OR CAPACITIVE TOUCH PANEL: VARIABLE GRID
- * FREE DEFINABLE KEY AND SWITCH
- * 8 DIGITAL IN- AND 8 DIGITAL OUTPUT
- * 2 ANALOGUE INPUTS COMFORTABLE TO USE

ORDERING CODES

GENERAL

The EA eDIP series of displays are the world's first displays with integrated intelligence. In addition to a variety of integrated fonts that can be used with pixel accuracy, they offer a whole range of sophisticated graphics functions.

The displays are ready for operation immediately with an operating voltage of 5V. They are controlled via one of the 3 integrated interfaces: RS-232, SPI or I²C. The displays are "programmed" by means of high-level language-type graphics commands. There is no longer any need for the time-consuming programming of character sets and graphics routines. The ease of use of this display with its touch panel dramatically reduces development times.

HARDWARE

The display is designed to work at an operating voltage of +5V. Data transfer is either serial and asynchronous in RS-232 format or synchronous via the SPI or I²C specification. To improve data security, a simple protocol is used for all types of transfer.

TOUCH PANEL

All versions are also available with an integrated touch panel: You can make entries and menu or bar graph settings by touching the display. The labeling of the "keys" is flexible and can also be changed during runtime (different languages, icons). The drawing of the individual "keys" and the labeling is handled by the integrated software. Depending on the field of aplication, you can use either the anolgue resitive version, designed for the use with pens, thick gloves, or the capacitive version with its immune hard glas surface.

LED ILLUMINATION

All displays are equipped with modern, energy-saving LED illumination. Brightness can be varied 0~100% by command.

In 24-hour operation, the illumination should be dimmed or switched off as often as possible to increase their lifetime.

SOFTWARE

This display is programmed by means of commands, such as *Draw a rectangle from (0,0) to (479,271)*. No additional software or drivers are required. Strings and images can be placed with **pixel accuracy**. Text and graphics can be combined at any time. Different character sets can be used at same time. Each character set and the images can be zoomed from 2 to 8 times and rotated in 90° steps. With the largest character set, the words and numbers displayed will fill the screen.

ACCESSORIES

Evaluation-Board (Programmer) for internal data flash memory

The display is shipped fully programmed and with all fonts. The additional Evaluation-Board is thus generally not required.

However, if the internal character sets have to be changed or extended, or if images or macros have to be stored internally, the Evaluation-Board EA 9777-2USB, which is available as an accessory, will burn the data/images you have created into the on-board <u>data flash memory (4 MB)</u> permanently.

The Evaluation-Board runs under Windows and is connected to the PC's USB interface. It is shipped with an interface cable and the installation software. The Evaluation-Board is equipped with serveral LEDs, pushbottons and potentiometer to test all peripherial modes of the eDIP.

Interface-Expansion for Evaluation-Board (included in the Starter-Kit):

Wtih the expansion EA 9777-2PE for the Evaluation-Board all interfaces of the display are made available with the help from small adapter boards: RS-232, RS-485, SPI, I²C, RS-232 (CMOS level). Further information you will find in the datasheet of the Evalution-Board.

Page 4

ELECTRONIC ASSEMBLY reserves the right to change specifications without prior notice. Printing and typographical errors reserved.

RS-232 INTERFACE

If the display is wired as shown below, the RS-232 interface is selected. The pin assignment is specified in the table on the right.

The RxD and TxD lines lead 5V (CMOS level) to a microcontroller, for example, for direct connection.

If "genuine" RS-232 levels are required (e.g. for connection to a PC), an external level converter (e.g. MAX232) is required.

BAUD RATES

The baud rate is set by means of pins 6, 7 and 8 (baud 0 to 2). The data format is set permanently to 8 data bits, 1 stop bit, no parity.

RTS/CTS handshake lines are not required. The required control is taken over by the integrated software protocol (see pages 10 and 11).

| | Baud Rates | | | | | | | | | | |

| | Startbit | D0 | D1 | D2 | | D4 | D5 | D6 | D7 | Stopbit |
|--|----------|-----------|-----------|-----------|--|-----------|-----------|-----------|----|---------|
|--|----------|-----------|-----------|-----------|--|-----------|-----------|-----------|----|---------|

Note:

The pins BAUD 0 to 2, ADR 0 to 2, DPOM, DPROT and TEST/SBUF have an internal pullup, which is why only the LO level (0=GND) is to be actively applied. These pins must be left open for a Hi level. For RS232 operation (without addressing) the pins ADR 0 to ADR 2 must be left open.

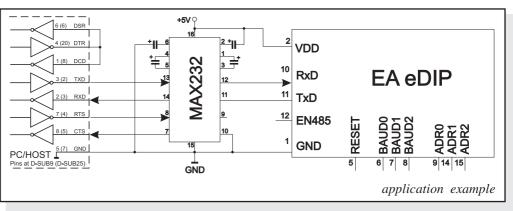

On pin 20 (SBUF) the display indicates with a low level that data is ready to be retrieved from the internal send buffer. The line can be connected to an interrupt input of the host system, for example.

APPLICATION EXAMPLE "REAL" RS-232 INTERFACE

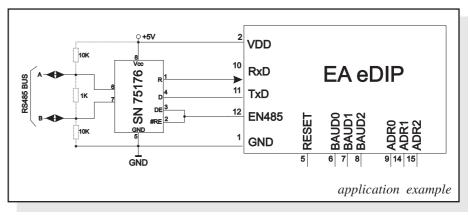

The eDIP fits for direct connection to a RS-232 interface with CMOS level (VDD).

If you have an interface with ±12V level, an external levelshifter is needed

APPLICATION EXAMPLE: RS-485 INTERFACE

With an external converter (e.g. SN75176), the EA eDIP can be connected to a 2-wire RS-485 bus. Large distances of up to 1200 m can thus be implemented (remote display). Several EA eDIP displays can be operated on a single RS-485 bus by setting addresses.

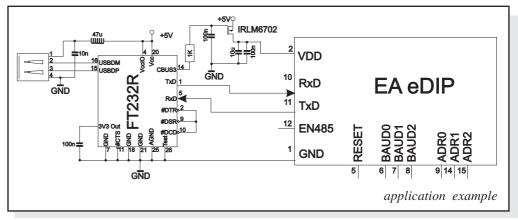

Addressing:

- Up to eight hardware addresses (0 to 7) can be set by means of Pins ADR0..ADR2
- The eDIP with the address 7 is selected and ready to receive after power-on.
- The eDIPS with the addresses 0 to 6 are deselcted after power-on
- Up to 246 further software addresses can be set by means of the '#KA adr' command in the power-on macro (set eDIP externally to address 0)

APPLICATION EXAMPLE: USB INTERFACE

With an external converter (e.g. FT232R) from FTDI the eDIP can be connected to an USB-Bus. Virtual-COM-Port drivers are available for different Systems on the FTDI Homepage: <u>http://www.ftdichip.com/drivers/vcp.htm.</u>

EAeDIPTFT43-A

Page 6

SPI INTERFACE

If the display is wired as shown below, SPI mode is activated. The data is then transferred via the serial, synchronous SPI interface.

The transfer parameter will be set via the pins DORD, CPOL and CPHA.

| | | | Pinout eDIPTFT43 | -A | : SF | l mode | | |
|-----|--------------|-----------|---|----|------|------------|--------|---|

| 15 | CPHA | In | Clock Phase sample 0=1st;1=2nd edge | | 35 | IN3 / MI6 | | open-drain with internal |
| 16 | BUZZ | Out | Buzzer output | | 36 | IN4 / MI5 | | pullup 2050k |
| 17 | DPROT | In | L: Disable Smallprotokoll do not connect for normal operation | | 37 | IN5 / MI4 | | alternativ up to 8 matrix keyboard input lines |
| 18 | DNC | Out | L: internal, do not connect | | 38 | IN6 / MI3 | | (reduces the digital input |
| 19 | WP | In | L: Writeprotect for DataFlash | | 39 | IN7 / MI2 | | lines, see chapter |
| 20 | TEST SBUF | IN Out | open-drain with internal pullup 2050k IN (Power-On) L: Testmode OUT L: data in sendbuffer | | 40 | IN8 / MI1 | | external keyboard) |

Note:

The pins DORD, CPOL, CPHA, DPOM, DPROT and TEST/SBUF have an internal pullup, which is why only the LO level (0=GND) *is to be actively applied. These pins must be left open for a Hi level.*

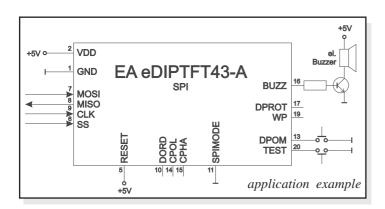

On pin 20 (SBUF) the display indicates with a low level that data is ready to be retrieved from the internal send buffer. The line can be connected to an interrupt input of the host system, for example.

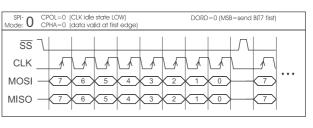

DATA TRANSFER SPI

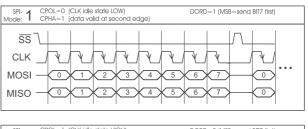

<u>Write operation:</u> a clock rate up to 200 kHz is allowed without any stop. Together with a pause of 100 μ s between every data byte a clock rate up to 3 MHz can be reached.

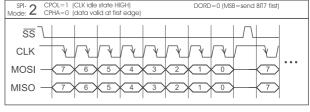

<u>Read operation:</u> to read data (e.g. the "ACK" byte) a dummy byte (e.g. 0xFF) need to be sent.

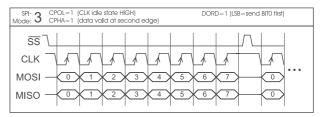

Note that the EA eDIP for internal operation does need a short time before providing the data; therefore a short pause of min. 6μ s (no activity of CLK line) is needed for each byte.

ELECTRONIC ASSEMBLY reserves the right to change specifications without prior notice. Printing and typographical errors reserved.

I²C-BUS INTERFACE

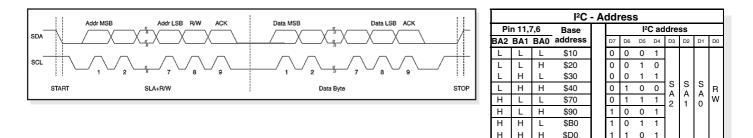

If the display is wired as shown below, it can be operated directly on an I²C bus. 8 different base addresses and 8 slave addresses can be selected on the display.

Data transfer is possible at up to 100 kHz. However, if pauses of at least 100 μ s are maintained between the individual bytes during transfer, a byte can be transferred at up to 400 kHz.

| 20 | 0 TEST IN SBUF Out | | open-drain with internal pullup 2050k IN (Power-On) L: Testmode OUT L: data in sendbuffer | | 40 | IN8 / MI1 | | external keyboard) |

Note:

The pins BA0 to 2, SA0 to 2, DPOM, DPROT and TEST/SBUF have an internal pullup, which is why only the LO level (L=0=GND) is to be actively applied. These pins must be left open for a Hi level (H=1). On pin 20 (SBUF) the display indicates with a low level that data is ready to be retrieved from the internal send buffer. The line can be connected to an interrupt input of the host system, for example.

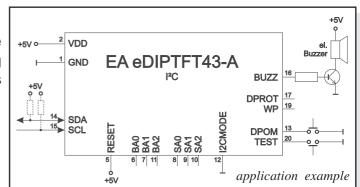

DATA TRANSFER I²C-BUS

principle I2C-bus transfer:

- I²C-Start
- Master-Transmit: EA eDIP-I²C-address (e.g. \$DE), send smallprotocol package (data)
- I²C-Stop
- I²C-Start
- Master-Read: EA eDIP-I²C-Address (e.g. \$DF), read ACK-byte and opt. smallprotocoll package (data)
- I²C-Stop

<u>Read operation:</u> for internal operation the EA eDIP does need a short time before providing the data; therefore a short pause of min. $6\mu s$ is needed for each byte (no activity of SCL line).

EAeDIPTFT43-A

all pins open: Write \$DE

Read \$DF

ANALOGUE INPUT AIN1 AND AIN2 (PIN 23+24)

For analogue measurement 2 inputs with a range of 0..VDD are available. Each input is grounded (GND) and DC impedance is $1M\Omega$. Please make sure that only positive voltages will be supplied there. Internal resolution is 10 Bit, equal to a 3-digit DVM modul. Linearity (after adjustment) is around 0.5%.

Adjustment

Analogue inputs are not calibrated when shipped out. A procedure for adjustment may be like that:

1.) Put a well known voltage within a range of 2-VDD to analogue input (example: 3,0V, AIN1)

2.) Run command for calibration (see page 16). Example: "ESC V @ 1 3000".

Each input query can be done via serial interface or directly shown on display (as digits or bargraph in various colors and sizes).

Best way for direct visualisation are Process-macros or one of Analogue-macros (e.g. starting at every voltage change, or above/below a limit).

Both input lines are scaleable from 0 to \pm 9999.9. Scaling will be done via definition at 2 voltages "value1=string1;value2=string2" (see table on page 16).

DIGITAL INPUT AND OUTPUT

The EA eDIP is featured with 8 digital input and 8 digital output lines (CMOS level, grounded).

8 outputs (Pin 25-32)

Each line can be controlled individually using the "ESC Y W" command. A maximum current of 10mA can be switched per line. This give the opportunity to drive a low power LED in direct way. To source higher current please use an external transistor.

8 inputs (Pin 33-40)

Each input provides an internal 20..50 k Ω pull-up resistor, so it is possible to connect a key or switch directly between input and GND. The inputs can be queried and evaluated directly via the serial interface ("ESC Y R").

> 500Ω

10k.O

 $\forall \mathcal{I}$

VDD

R_{Las}

LED

OUT1..8

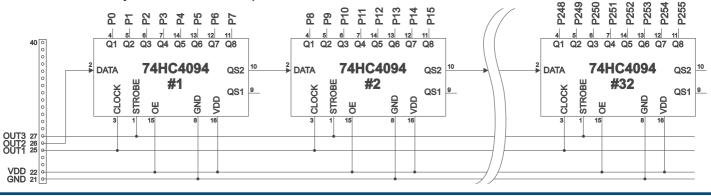

In addition to that every port change may start an individual port - or bit- macro (see p. 28).

The command "ESC Y A 1" activates automatic port query. Every alteration of inputs firstly calls bit macros and afterwards port macros. If there is no definied macro, the new status is transfered into the send buffer (refer to p. 19).

<u>Note:</u> The logic circuitry is designed for slow operations; in other words, more than 3 changes per second cannot be easily executed.

EXTENDED OUTPUTS (V1.4 AND HIGHER)

It is possible to connect 1 to 32 chips like 74HC4094 to the eDIP (OUT1...OUT3), this is why it is attainable to have 8 to 256 additional outputs. The command "ESCYE n1 n2 n3" (see p. 17) provides a comfortable way to control the outputs.

EXTERNAL KEYBOARD

A keyboard (anything from individual keys to a 8x8 matrix keyboard) can be connected to the I/O-ports. The command 'ESC Y M n1 n2 n3' defines the count of input lines (n1=1..8) and output lines (n2=1..8). n3 set debounce function with 10ms steps (n3=0..15). Please note that count of digital input and output lines will be reduced while connecting an external keyboard at the same port.

Each key is connected with 1 output and 1 input. All inputs are terminated with a 20..50k Ω pull-up resistor. For double-keytroke function decoupling of outputs is necessary. For that please use schottky diodes (e.g. BAT 46).

Transmitting the keystrokes

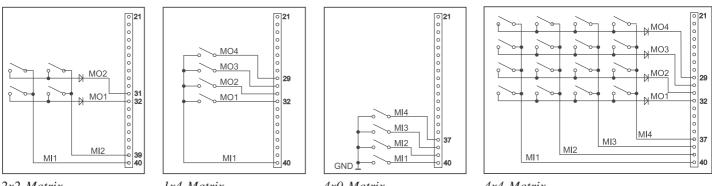

At each keystroke, the associated key number (1..64) is transmitted or - if a corresponding Matrix-Macro is defined, Matrix-Macro will be started. The release of the key is not transmitted. If the release of the key is to be transmitted as well, this can be done by defining Matrix-Macro no. 0. (see page 19: Responses of EA eDIPTFT43-A)

Calculation of key numbers:

Key_number = (output-1) * count_of_inputs + input (output = MOx, input = MIx).

Examples

- 2x2 matrix: Command 'ESCY M 2 2..' defines the 2x2 matrix. Keypad will need input lines MI1, MI2 and output lines MO1, MO2. Output lines are decoupled by diodes; this is for double keystrokes necessary. 6 input and 6 output lines remain free for other requirements.
- 1x4 matrix: Command 'ESC Y M 1 4 ..' defines the 1x4 matrix. Keypad will need output lines MO1..MO4 and a single input line MI1. With that connection 7 input and 4 output lines remain free for other requirements.
- 4x0 matrix: Using one single output only (physically 4x1 Matrix), all keys can switch to GND. So no output line is necessary and comman 'ESCYM40..' defines 4 input lines onyl. With that connection 4 input and 8 output lines remain free for other requirements.
- 4x4 matrix: Command 'ESCY M 4 4 ..' defines the 4x4 matrix. Keypad will need input lines MI1..MI4 and output lines MO1..MO4. Output lines are decoupled by diodes; this is for double keystrokes necessary. 4 input and 4 output lines remain free for other requirements.

1x4 Matrix

4x0 Matrix

4x4 Matrix

EAeDIPTFT43-A

Page 9

DATA TRANSFER PROTOCOL (SMALL PROTOCOL)

The protocol has an identical structure for all 3 interface types: RS-232, SPI and I²C. Each data transfer is embedded in a fixed frame with a checksum (protocol package). The EA eDIPTFT43-A acknowledges this package with the character <ACK> (=\$06) on successful receipt or <NAK> (=\$15) in the event of an incorrect checksum or receive buffer overflow. In the case of <NAK>, the entire package is rejected and must be sent again.

Receiving the <ACK> byte means only that the protocol package is ok, there is no syntax check for the command.

Note: it is neccessary to read the <ACK> byte in any case.

If the host computer does not receive an acknowledgment, at least one byte is lost. In this case, the set timeout has to elapse before the package is sent again.

The raw data volume per package is limited to 255 bytes (len <= 255). Commands longer than 255 bytes (e.g. Load image ESC UL...) must be divided up between a number of packages. All data in the packages are compiled again after being correctly received by the EA eDIPTFT43-A.

DEACTIVATING THE SMALL PROTOCOL

For tests the protocol can be switched off with an L level at pin 17 = DPROT. In normal operation, however, you are urgently advised to activate the protocol. If you do not, any overflow of the receive buffer will not be detected.

BUILDING THE SMALLPROTOCOL PACKAGES

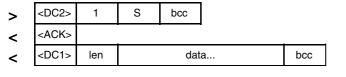

Command/Data to the display

| > | <dc1></dc1> | len | data | bcc |
|---|-------------|-----|------|-----|
| < | <ack></ack> | | | |

<DC1> = 17(dec.) = \$11 <ACK> = 6(dec.) = \$06len = count of user data (without <DC1>, without checksum bcc) bcc = 1 byte = sum of all bytes incl. <DC1> and len, modulo 256

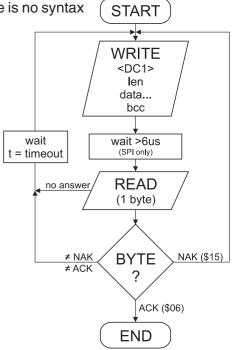

| | Clear display and draw a line from 0,0 to 479,271 | | | | | | | | | | | | | | | | |
|---|---|------|------|------|------|------|------|------|-------------------|------|------|---|------|---------------|---|----|-------------|
| > | <dc1></dc1> | len | ESC | D | L | ESC | G | D | (|) | (|) | 4 | 79 | 2 | 71 | bcc |
| < | \$11 < ACK > \$06 | \$0E | \$1B | \$44 | \$4C | \$1B | \$47 | \$44 | \$00 <i>Ex</i> | \$00 | \$00 | | \$DF | \$01 ete a | | | \$60 age |

Request for content of send buffer

<DC2> = 18(dec.) = \$12 1 = 1(dez.) = \$01 S = 83(dez.) = \$53<ACK> = 6(dec.) = \$06

len = *count of user data (without <DC2>, without checksum bcc) bcc* = 1 byte = sum of all bytes incl. <DC2>, modulo 256

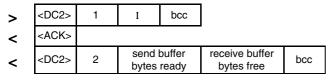

The user data is transferred framed by <DC1>, the number of bytes (len) and the checksum (bcc). The display responds with <ACK>.

| voidSendData(unsigned cha | <pre>voidSendData(unsigned char *buf, unsigned char len) {</pre> | | | | | | | | |
|--|--|--|--|--|--|--|--|--|--|
| unsigned char i, bcc; | | | | | | | | | |
| <pre>SendByte(0x11); bcc = 0x11;</pre> | // Send DC1 | | | | | | | | |
| <pre>SendByte(len); bcc = bcc + len;</pre> | // Send data length | | | | | | | | |
| <pre>for(i=0; i < len; i++) { SendByte(buf[i]); bcc = bcc + buf[i]; }</pre> | // Send buf | | | | | | | | |
| SendByte(bcc); } | // Send checksum | | | | | | | | |
| "C" source code to transmit a data package | | | | | | | | | |

The command sequence <DC2>, 1, S, bcc empties the display's send buffer. The display replies with the acknowledgement <ACK> and the begins to send all the collected data such as touch keystrokes.

Request for buffer information

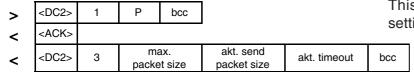

<DC2> = 18(dec.) = \$12 l = l(dez.) = \$01 I = 73(dez.) = \$49<ACK> = 6(dec.) = \$06

send buffer bytes ready = count of bytes stored in send buffer receive buffer bytes free = count of bytes for free receive buffer bcc = 1 byte = sum of all bytes incl. <DC2>, modulo 256

Protocol settings

| > | <dc2></dc2> | 3 | D | packet size for send buffer | timeout | bcc |
|---|-------------|---|---|--------------------------------|---------|-----|
| < | <ack></ack> | | | | | |

Request for protocol settings

<DC2> = 18(dec.) = \$12 1 = 1(dez.) = \$01 P = 80(dez.) = \$50

 $<\!ACK\!> = 6(dec.) = 06

max. packet size = count of maximum user data for 1 package (eDIPTFT43-A = 255) akt. send packet size = current package size for send

akt. timeout = current timeout in 1/100 seconds

bcc = 1 *byte* = *sum of all bytes incl. <DC2>, modulo* 256

Repeat the last package

<DC2> = 18(dec.) = \$12 l = 1(dez.) = \$01 R = 82(dez.) = \$52<ACK> = 6(dec.) = \$06

<*DC1*> = 17(*dec.*) = \$11

len = *count of user data in byte (without ckecksum, without <DC1> or <DC2>) bcc* = 1 byte = sum of all bytes incl. <DC2> and len, modulo 256

Adressing (only for RS232/RS485)

| > | <dc2></dc2> | 3 | А | select or deselect | adr | bcc |
|---|-------------|---|---|-----------------------|-----|-----|
| < | <ack></ack> | | | | | |

<DC2> = 18(dec.) = \$12 3 = 3(dez.) = \$03 A = 65(dez.) = \$41select or deselect: 'S' = \$53 or 'D' = \$44 adr = 0..255bcc = 1 byte = sum of all bytes incl. <DC2> and adr, modulo 256 <ACK> = 6(dec.) = \$06 This command queries whether user data is ready to be picked up an how full the display's receive buffer is.

This is how the maximum package size that can be sent by the display can be limited. The default setting is a package size with up to 128 bytes of user data.

The timeout can be set in increments of 1/100 seconds. The timeout is activated when individual bytes get lost. The entire package then has to be sent again.

This command is used to query protocol settings.

If the most recently requested package contains an incorrect checksum, the entire package can be requested again. The reply can then be the contents of the send buffer (<DC1>) or the buffer/protocol information (<DC2>).

This command can be used to select or deselect the eDIP with the address adr.

TERMINAL MODE

When you switch the unit on, the cursor flashes in the first line, indicating that the display is ready for operation. All the incoming characters are displayed in ASCII format on the terminal (exception: CR,LF,FF,ESC,'#'). The prerequisite for this is a working protocol frame or a deactivated protocol (see pages 10 and 11).

Line breaks are automatic or can be executed by means of the 'LF' character. If the last line is full, the contents of the terminal scroll upward. The 'FF' character (page feed) deletes the terminal.

The character '#' is used as an escape character and thus cannot be displayed directly on the terminal. If the character '#' is to be output on the terminal, it must be transmitted twice: '##'.

The size of the terminal-window can be set by command 'ESC TW'.

Attention: Graphic commands are able to draw inside terminal window. For example 'ESC DL' will delete terminal window, too.

Terminal-Font 2: 8x16

USING THE SERIAL INTERFACE

The operating unit can be programmed by means of various integrated commands. Each command begins with ESCAPE followed by one or two command letters and then parameters. There are two ways to transmit commands:

1. ASCII mode

- The ESC character corresponds to the character '#' (hex: \$23, dec: 35).
- The command letters come directly after the '#' character.
- The parameters are transmitted as plain text (several ASCII characters) followed by a separating character (such as a comma ',') also after the last parameter e.g.: **#GD0,0,479,271**,
- Strings (text) are written directly without quotation marks and concluded with CR (hex: \$0D) or LF (hex: \$0A).

2. Binary mode

- The escape character corresponds to the character ESC (hex: \$1B, dec: 27).
- The command letters are transmitted directly.
- The coordinates xx and yy are transmitted as 16-bit binary values (first the LOW byte and then the HIGH byte).
- All the other parameters are transmitted as 8-bit binary values (1 byte).
- Strings (text) are concluded with CR (hex: \$0D) or LF (hex: \$0A) or NUL (hex: \$00).

No separating characters, such as spaces or commas, may be used in binary mode.

The commands require **no final byte**, such as a carriage return (apart from the string \$00).

ALL COMMANDS AT A GLANCE

The built-in intelligence allows an easy creation of your individual screen content. Below mentioned commands can be used either directly via the serial interface (see page 12) or together with the self-definable macro (see pages 26/28).

| Send bytes | | | в | num | | dat | a | num (=1 to 255) bytes are sent to the sendbuffer data = num Bytes. In the source text of the macro programming, the number num must not be specified. This is counted by the ediptftcompiler and entered. | |
| Send version | ESC | s | v | | | | | The version is sent as a string to sendbuffer e.g. "EA eDIPTFT43-A V1.0 Rev.A TP+" | |
| Send projectname | | J | | | | | The macro-projectname is sent as a string to the sendbuffer e.g. "init / delivery state" | | |
| Send internal infos | | | 1 | | | | | Internal information about the edip is sent to the sendbuffer. | |

EAeDIPTFT43-A

Page 18

TOUCH PANEL

The Version EA eDIPTFT43-ATP is shipped with an analog, resistive touch panel, the version EA eDIPTFT43-ATC with a capacitive touch panel. Up to 60 touch areas (keys, switches, menus, bar graph inputs) can be defined simultaneously. The fields can be defined with pixel accuracy. The display supports user-friendly commands. When the touch "keys" are touched, they can be automatically inverted and an external tone can sound (pin 16), indicating they have been touched. The predefined return code of the "key" is transmitted via the interface, or an internal touch macro with the number of the return code is started instead.

| | | | | xx1 | yy1 | n1 | | | | area | | | |

TOUICH ADJUSTMENT (ONLY VALID FOR RESESTIVE TOUCH EA EDIPTFT43-ATP)

The touch panel is perfectly adjusted and immediately ready for operation on delivery. As a result of aging and wear, it may become necessary to readjust the touch panel:

- 1a. Send Command 'ESC A@' or
- 1b. Touch the touch panel at power-on and keep it depressed. After the message "touch adjustment ?" appears, release the touch panel. Touch the touch panel again within a second for at least a second.
- 2. Follow the instructions for adjustment (press the 2 points upper left and lower right).

RESPONSE OF THE EA eDIPTFT43-A VIA SERIAL INTERFACE

The table below contains all response codes. Some response data will come automatically some others on request. In addition to that with command 'ESC SB ...' user is able to transmit individual data packages. All reponses are placed into the sendbuffer. With the smallprotocol command 'Request for content of send buffer' (see page10) the host can read out the sendbuffer. This can be done per polling, alternativly pin 20 'SBUF' shows with LO-signal that data is ready to transmit.

| | | | | | | | Responses of the EA eDIPTFT43-A |
|-----|---|-----|-------|--------|---|-------|---|
| lo | d | num | | | data | | Remarks |
| | | | | | | а | utomatic responses (placed into sendbuffer) |
| ESC | Α | 1 | code | | | | Response from the analog touch panel when a key/switch is pressed. code = down or up code of the key/switch. It is on transmitted if no touch macro with the number code is defined ! |
| ESC | в | 2 | no | value | | | When a bargraph is set by touch, the current value of the bar no is transmitted. Transmission of the bar balue must be activated (see the 'ESC A Q n1' command). |
| ESC | F | 2 | no | value | | | When a instrument is set by touch, the current value of the instrument no is transmitted. Transmission of the intstrument must be activated (see the 'ESC A Q n1' command). |
| ESC | Ρ | 1 | value | | | | After the input port is changed, the new 8-bit value is transmitted. The automatic port scan must be activated. See the 'E A n1' command. It is only transmitted when there is no corresponding port/bit macro defined ! |
| ESC | м | 1 | no | | | | When a keystroke of the external matrix keyboard is detected, the newly pressed key number no is transmitted. Only transmitted if no corresponding matrix macro is defined ! |
| ESC | Н | 5 | type | xLO | xHI yLO | уHI | The following is transmitted in the case of a free touch area event: type=0 is release; type=1 is touch; type=2 is drag with free touch area at the coordinates xx1, yy1 |
| | | | | | Respon | se on | y when requested by command (placed into sendbuffer) |
| ESC | в | 2 | no | value | | | After the 'ESC B S n1' command, the current value of the bar with the number no is transmitted. |
| ESC | F | 2 | no | value | | | After the 'ESC I S n1' command, the current value of the instrument with the number no is transmitted. |
| ESC | х | 2 | code | value | | | After the 'ESC A X' command, the current status (value=0 or 1) of the touch switch code is transmitted. |
| ESC | G | 2 | no | code | | | After the 'ESC A G nR' command, the code of the active touch switch in the radio group no is sent. |
| ESC | Y | 2 | no | value | | | After the 'ESC Y R' command, the requested input port is transmitted. no=0: value is an 8-bit binary value of all 8 inputs. no=18: value is 0 or 1 depending on the status of the input no |
| ESC | D | 3 | ch | LOval | Hlval | | After the 'ESC V D ch' command, the requested voltage of channel ch=12 will be sent (value = 05000mV) |
| ESC | w | num | ch | SCa | aled ASCII string | J | After the 'ESC V S ch' command, the requested voltage of channel ch=12 will be set as scaled ASCII characters (lengt string = num-1). |
| ESC | v | num | | vers | sion string | | After the 'ESC S V' command, the version of the edip firmware is transmitted as a string e.g. "EA eDIPTFT43-A V1.0 Rev.A TP+" |
| ESC | J | num | | projec | tname string | | After the 'ESC S J' command, the macro-projectname is transmitted. e.g. "init / delivery state" |
| ESC | I | 21 | C | CRC-RO | s, Version, Touc M, CRC-ROMso DF in KB, CRC-DFsoll, DF | bll | after the 'ESC S I' command, internal information is sent by eDIP (16-Bit integer values LO-HI Byte) Version: LO-Byte = version number Software; HI-Byte = Hardware revison letter touch Touchinfo: LO-Byte = '- +' X direction detected; HI-Byte = '- +' Y direction detected DFIen: number of user bytes in data flash memory (3 Bytes: LO-, MID- HI-Byte) |
| | | | | | | R | esponses without length specification (num) |
| ESC | U | L | xx1 | yy1 | image data (G16-FORM | | after the 'ESC UH' command, a hard copy is sent in G16-format. xx1,yy1 = Start coordinates of the hard copy (upper left corner) |

PRELOADED FONTS

As standard, there are 3 monospaced, 3 proportional character sets and 2 large digit fonts integrated. The proportional character sets (which have a narrow "I" and a wide "W", for example) look better and take up less space on the screen. Each character can be placed with **pixel accuracy**, and its height and width can be increased by a factor of 1 to 8. A text can be output left justified, right justified or centered. Rotation in 90° steps is possible. Macro programming permits further fonts to be integrated.

All kinds of fonts can be converted from True-Type Fonts by using using the LCD toolkit/ eDIPTFTcompiler (the USB Evaluation Board EA 9777-2USB is required).

ADDITIONAL FONTS

Up to 256 fonts a 16 pages can be loaded into the internal DataFlash.

Page 22

COMPILER OPTION "WinFont:"

It is possible to raster TrueType-Fonts in different sizes witch can be used. A doubleclick to the fontname within the KitEditor opens the font selection box.

To simplify the use of fonts, there is the possibility of a edit box. If you output a string with KitEditor (e.g. #ZL 5,5, "Hello"), you can perform a double click on the string to open it.

Now you can select the desired characters. This is mainly recommended

using cyrillic, asian or symbol fonts.

In that way, the KitEditor automatically places the right ASCII-Code. Alternativly you can use instead of the quotation mark curly brackets (e.g. +ZL 5,5, {48656C6C6F}).

COMPILER OPTION "Font:"

Following font formats can be used:

- FXT: Textfont as used by eDIP240/320 and KIT series
- G16: internal eDIPTFT format (with this format it is possible to user color fonts)

EA eDIPTFT32-A is able to work with 65,536 colors for true-color pictures/icons and animations. For an easy use there exists a color palette with 32 entrys (16 colors are predefined after PowerOn). This color palette can be

> redefined at any time without changing the content of the display (command: ESC FP no R G B). To use a color for text and graphic functions you set only a number between 1..32.

The dummy color number 255 means that the actually color is not changed e.g you want only to change the foreground- and not the background color. The color number 0=transparent is special and can be used for background of character e.g. that means that for placing a character no rectangular field will be deleted around the character itself. The sensless combination of transparent background and

transparent foreground is used to

invert all dots (=complementary). Two times inverted will end same as action was started (original drawing is restored).

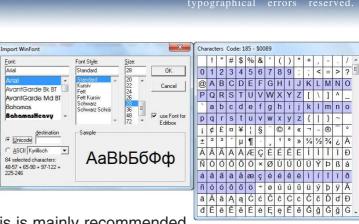

some examples to show the letter 'A' onto a fixed background

typographical errors reserved Characters Code: 185 - \$0089

ELECTRONIC ASSEMBLY reserves

the right to change specifications without prior notice. Printing and

ELECTRONIC SSEMBLY making things easy

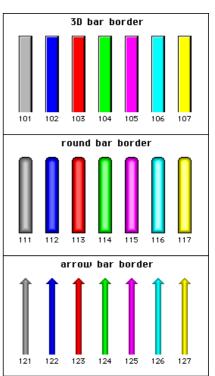

BORDERS, KEY STYLES AND BARGRAPH

The eDIP is shipped with 20 predefined border (no:1..20) for the

commands draw box frame and draw touchkeys. There are also three special borders in various colors for using with bargraph commands (no:101..107, 111..117 and 121..127). All of them can be used in various sizes via coordinates. The frames 1..20 are split into 3 segments: the outer frame, inner frame and filling. Each segment will get an individual colour for normal and for selected state. This will give the user

the opportunity, when touching a field, the individual part of the key will be inverted only.

EAeDIPTFT43-A

Page 23

FILL PATTERNS

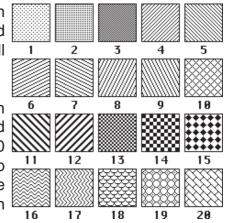

A pattern type can be set as a parameter with various commands. In this way, for example, rectangular areas and bar graphs can be filled with different patterns. The eDIP is shipped with 20 predefined fill patterns.

Define own pattern:

With the LCD-tools it is possible to define new pattern (=bitmaps with exactly 8x8 dots).(Compileroption "Pattern:"). The foreground- and backgound color can be set for monochrome pattern (as the 20

preloaded pattern) incl. transparency. It is also possible to define full colored pattern. With the LCD-tools some sample pattern has been installed (see folder 'Pattern').

⁹ full version is free available on web at <u>http://www.lcd-module.de/eng/dip/edip.htm</u>

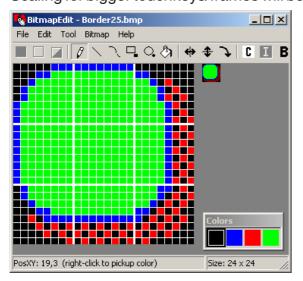

Page 24

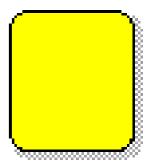

ELECTRONIC ASSEMBLY reserves the right to change specifications without prior notice. Printing and typographical errors reserved.

DEFINE OWN BORDER

With the LCD-tools it is possible to define new borders (Compileroption "Border:"). Each of these new border is a bitmap with exactly 24x24 dots (9 segments with 8x8 dots: 4x edge, 4x middle part, 1x filling). Scaling for bigger touchkeys/frames will be done by repetition of these 8x8 dot

segments. This makes it necessary to keep the 8x8 size in every case. If 4-color bitmaps are used (as the preloaded border 1..20) the color can be set individually (the first color is always transparent and is not used by the eDIP). It is also possible to define full colored border (as the preloaded border for bargraphs 101...127).With the

border25: 50x56 Dot size

LCD-tools some sample border has been installed (see folder 'Bitmaps\Color\Border').

ROTARY AND POINTER INSTRUMENTS (since V. 1.4)

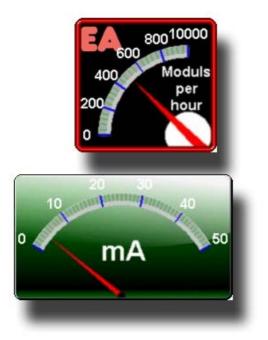

With the help of the LCD-Tools it is possible to include instruments (Compiler command: Instrument: 4, <instrument.il6>). Performing a double click in the KitEditor on the instrument file opens the instrument editor.

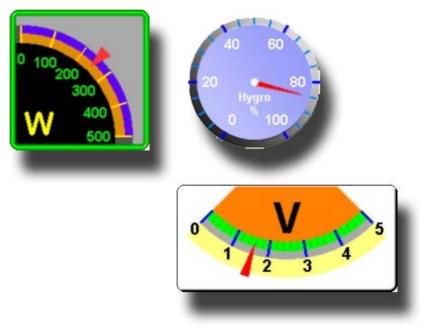

The instruments are supported by convinient commands ('ESC I..'). For example the instruments are connectable to an analog input. In addition they are configurable by touch.

| Instrument Editor - compass.I16 | _ | × | 239x239, RP:119,119 |

Some instrument examples:

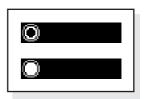

BUTTONS AS KEYS

Apart from the border types, which are infinitely scalable, it is also possible to use bitmaps as touch keys or touch switches (Compileration "Button:").

A button always consists of two Bitmaps of equal size (one bitmap to display the touch key in its normal state and another for when it is pressed).

The active area of the touch key automatically results from the size of the button bitmaps.

SWITCHES IN GROUPS (RADIO GROUPS)

Touch switches change their status from *ON* to *OFF* or vice versa each time they are touched. Several touch switches can be included in a group ('ESC A R n1' command). If a touch switch in the group 'n1' is switched on, all the other touch switches in this group are automatically switched off. Only one switch is ever on (see table on page 16).
