EPC2108 – Enhancement-Mode GaN Power Transistor Half-Bridge with Integrated Synchronous Bootstrap

V_{DSS} , 60 V
$R_{DS(on)}$, 240 mΩ
I_D , 1.7 A

Gallium Nitride is grown on Silicon Wafers and processed using standard CMOS equipment leveraging the infrastructure that has been developed over the last 60 years. GaN's exceptionally high electron mobility and low temperature coefficient allows very low $R_{DS(on)}$, while its lateral device structure and majority carrier diode provide exceptionally low Q_G and zero Q_{RR}. The end result is a device that can handle tasks where very high switching frequency, and low on-time are beneficial as well as those where on-state losses dominate.
