Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Development Board EPC9031/32/33/34/35 Quick Start Guide

Half-bridge with Gate Drive for EPC2020/21/22/23/24

DESCRIPTION

These development boards are in a half-bridge topology with onboard gate drives, featuring the EPC2020/21/22/23/24 eGaN® field effect transistors (FETs). The purpose of these development boards is to simplify the evaluation process of these eGaN FETs by including all the critical components on a single board that can be easily connected into any existing converter.

The development board is 2" x 1.5" and contains two eGaN FETs in a half-bridge configuration using the Texas Instruments LM5113 gate driver, supply and bypass capacitors. The board contains all critical components and layout for optimal switching performance. There are also various probe points to facilitate simple waveform measurement and efficiency calculation. A complete block diagram of the circuit is given in Figure 1.

For more information on the EPC2020/21/22/23/24 eGaN FETs, please refer to the datasheets available from EPC at www.epc-co.com. The datasheet should be read in conjunction with this quick start guide.

Table 1: Performance Summary ($T_A = 25$ °C)

Symbol	Parameter	Conditions	Min	Max	Units
V_{DD}	Gate Drive Input Supply Range		7	12	V
V_{IN}	Bus Input Voltage Range	When using 30 V devices, EPC9031		24*	V
		When using 40 V devices, EPC9032		32*	V
		When using 60 V devices, EPC9033		48*	V
		When using 80 V devices, EPC9034		64*	V
		When using 100 V devices, EPC9035		80*	V
V_{OUT}	Switch Node Output Voltage	When using 30 V devices, EPC9031		30	V
		When using 40 V devices, EPC9032		40	V
		When using 60 V devices, EPC9033		60	V
		When using 80 V devices, EPC9034		80	V
		When using 100 V devices, EPC9035		100	V
I_{OUT}	Switch Node Output Current	When using 30 V devices, EPC9031		40*	A
		When using 40 V devices, EPC9032		35*	A
		When using 60 V devices, EPC9033		30*	A
		When using 80 V devices, EPC9034		27*	A
		When using 100 V devices, EPC9035		25*	A
V_{PWM}	PWM Logic Input Voltage Threshold	Input 'Low'	3.5	6	V
		Input 'High'	0	1.5	V
	Minimum "High" State Input Pulse Width	V_{PWM} rise and fall time < 10ns	50		ns
	Minimum "Low" State Input Pulse Width	V_{PWM} rise and fall time < 10ns	100#		ns

*Assumes inductive load, maximum current depends on die temperature – actual maximum current with be subject to switching frequency, bus voltage and thermal cooling.

# Limited by time needed to 'refresh' high side bootstrap supply voltage.

QUICK START PROCEDURE

The development boards are easy to set up to evaluate the performance of the eGaN FET. Refer to Figure 2 for proper connect and measurement setup and follow the procedure below:

1. With power off, connect the input power supply bus to +V_{IN} (J5, J6) and ground / return to –V_{IN} (J7, J8).

2. With power off, connect the switch node of the half-bridge OUT (J3, J4) to your circuit as required.

3. With power off, connect the gate drive input to +V_{DD} (J1, Pin-1) and ground return to –V_{DD} (J1, Pin-2).

4. With power off, connect the input PWM control signal to PWM (J2, Pin-1) and ground return to any of the remaining J2 pins.

5. Turn on the gate drive supply – make sure the supply is between 7 V and 12 V range.

6. Turn on the bus voltage to the required value (do not exceed the absolute maximum voltage on V_{OUT} as indicated in the table below:

    a. EPC9031, 30 V

    b. EPC9032, 40 V

    c. EPC9033, 60 V

    d. EPC9034, 80 V

    e. EPC9035, 100 V

7. Turn on the controller / PWM input source and probe switching node to see switching operation.

8. Once operational, adjust the bus voltage and load PWM control within the operating range and observe the output switching behavior, efficiency and other parameters.

9. For shutdown, please follow steps in reverse.

NOTE. When measuring the high frequency content switch node (OUT), care must be taken to avoid long ground leads. Measure the switch node (OUT) by placing the oscilloscope probe tip through the large via on the switch node (designed for this purpose) and grounding the probe directly across the GND terminals provided. See Figure 3 for proper scope probe technique.

THERMAL CONSIDERATIONS

The EPC9031/32/33/34/35 development boards showcase the EPC2020/21/22/23/24 eGaN FETs. Although the electrical performance surpasses that for traditional Si devices, their relatively smaller size does magnify the thermal management requirements. These development boards are intended for bench evaluation with low ambient temperature and convection cooling. The addition of heat-sinking and forced air cooling can significantly increase the current rating of these devices, but care must be taken to not exceed the absolute maximum die temperature of 150°C.

NOTE. The EPC9031/32/33/34/35 development boards do not have any current or thermal protection on board. on board.
