

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications

PART NUMBER:

KXTF9-4100
Rev. 6
Jun-2011

Product Description

The KXTF9 is a tri-axis +/-2g, +/-4g or +/-8g silicon micromachined accelerometer with integrated orientation, tap/double tap, and activity detecting algorithms. The sense element is fabricated using Kionix's proprietary plasma micromachining process technology. Acceleration sensing is based on the principle of a differential capacitance arising from acceleration-induced motion of the sense element, which further utilizes common mode cancellation to decrease errors from process variation, temperature, and environmental stress. The sense element is hermetically sealed at the wafer level by bonding a second silicon lid wafer to the device using a glass frit. A separate ASIC device packaged with the sense element provides signal conditioning, and intelligent user-programmable application algorithms. The accelerometer is delivered in a 3 x 3 x 0.9 mm LGA plastic package operating from a 1.8 – 3.6V DC supply. I²C interface is used to communicate to the chip to configure and check updates to the orientation, Directional Tap™ detection and activity monitoring algorithms.

Table 2. Electrical

(specifications are for operation at 1.8V and T = 25C unless stated otherwise)

Parameters		Units	Min	Typical	Max
Supply Voltage (V _{dd})	Operating	V	1.8	1.8	3.6
I/O Pads Supply Voltage (V _{IO})		V	1.7		V _{dd}
Current Consumption	All On (Res = 1)	µA	470	570	670
	All On (RES = 0)			230	
	Standby			0.1	
Output Low Voltage ¹		V	-	-	0.2 * V _{IO}
Output High Voltage		V	0.9 * V _{IO}	-	-
Input Low Voltage		V	-	-	0.2 * V _{IO}
Input High Voltage		V	0.8 * V _{IO}	-	-
Input Pull-down Current		µA		0	
Start Up Time ²	RES = 0	ms		0.050	
	RES = 1, ODR = 25 Hz			80	
	RES = 1, ODR = 50Hz			40	
	RES = 1, ODR = 100Hz			20	
	RES = 1, ODR = 200Hz			10	
	RES = 1, ODR = 400Hz			5	
	RES = 1, ODR = 800Hz			2.5	
Power Up Time ³		ms		20	
I ² C Communication Rate		kHz			400
Output Data Rate (ODR) ⁴		Hz	25	50	800
Bandwidth (-3dB) ⁵	RES = 0	kHz		1.59	
	RES = 1	Hz		ODR/2	

Notes:

1. Assuming I²C communication and minimum 1.5kΩ pull-up resistor on SCL and SDA pins. Assuming V_{IO} < 2V, if V_{IO} > 2 V then the maximum Output Low Voltage is 0.4V.
2. Start up time is from PC1 set to valid outputs.
3. Power up time is from V_{dd} valid to device boot completion.
4. User selectable through I²C.
5. User selectable and dependant on ODR and RES.

ESD	HBM	V	-	-	2000

Caution: ESD Sensitive and Mechanical Shock Sensitive Component, improper handling can cause permanent damage to the device.

This product conforms to Directive 2002/95/EC of the European Parliament and of the Council of the European Union (RoHS). Specifically, this product does not contain lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB), or polybrominated diphenyl ethers (PBDE) above the maximum concentration values (MCV) by weight in any of its homogenous materials. Homogenous materials are "of uniform composition throughout."

This product is halogen-free per IEC 61249-2-21. Specifically, the materials used in this product contain a maximum total halogen content of 1500 ppm with less than 900-ppm bromine and less than 900-ppm chlorine.

Soldering

KXTF9 Digital Interface

The Kionix KXTF9 digital accelerometer has the ability to communicate on the I²C digital serial interface bus. This flexibility allows for easy system integration by eliminating analog-to-digital converter requirements and by providing direct communication with system micro-controllers.

The serial interface terms and descriptions as indicated in Table 6 below will be observed throughout this document.

Term	Description
Transmitter	The device that transmits data to the bus.
Receiver	The device that receives data from the bus.
Master	The device that initiates a transfer, generates clock signals, and terminates a transfer.
Slave	The device addressed by the Master.

Table 6. Serial Interface Terminologies

I²C Serial Interface

As previously mentioned, the KXTF9 has the ability to communicate on an I²C bus. I²C is primarily used for synchronous serial communication between a Master device and one or more Slave devices. The Master, typically a micro controller, provides the serial clock signal and addresses Slave devices on the bus. The KXTF9 always operates as a Slave device during standard Master-Slave I²C operation.

I²C is a two-wire serial interface that contains a Serial Clock (SCL) line and a Serial Data (SDA) line. SCL is a serial clock that is provided by the Master, but can be held low by any Slave device, putting the Master into a wait condition. SDA is a bi-directional line used to transmit and receive data to and from the interface. Data is transmitted MSB (Most Significant Bit) first in 8-bit per byte format, and the number of bytes transmitted per transfer is unlimited. The I²C bus is considered free when both lines are high.

I²C Operation

Transactions on the I²C bus begin after the Master transmits a start condition (S), which is defined as a high-to-low transition on the data line while the SCL line is held high. The bus is considered busy after this condition. The next byte of data transmitted after the start condition contains the Slave Address (SAD) in the seven MSBs (Most Significant Bits), and the LSB (Least Significant Bit) tells whether the Master will be receiving data '1' from the Slave or transmitting data '0' to the Slave. When a Slave Address is sent, each device on the bus compares the seven MSBs with its internally stored address. If they match, the device considers itself addressed by the Master. The Slave Address associated with the KXTF9 is 0001111.

± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications

PART NUMBER:

**KXTF9-4100
Rev. 6
Jun-2011**

It is mandatory that receiving devices acknowledge (ACK) each transaction. Therefore, the transmitter must release the SDA line during this ACK pulse. The receiver then pulls the data line low so that it remains stable low during the high period of the ACK clock pulse. A receiver that has been addressed, whether it is Master or Slave, is obliged to generate an ACK after each byte of data has been received. To conclude a transaction, the Master must transmit a stop condition (P) by transitioning the SDA line from low to high while SCL is high. The I²C bus is now free.

Writing to a KXTF9 8-bit Register

Upon power up, the Master must write to the KXTF9's control registers to set its operational mode. Therefore, when writing to a control register on the I²C bus, as shown Sequence 1 on the following page, the following protocol must be observed: After a start condition, SAD+W transmission, and the KXTF9 ACK has been returned, an 8-bit Register Address (RA) command is transmitted by the Master. This command is telling the KXTF9 to which 8-bit register the Master will be writing the data. Since this is I²C mode, the MSB of the RA command should always be zero (0). The KXTF9 acknowledges the RA and the Master transmits the data to be stored in the 8-bit register. The KXTF9 acknowledges that it has received the data and the Master transmits a stop condition (P) to end the data transfer. The data sent to the KXTF9 is now stored in the appropriate register. The KXTF9 automatically increments the received RA commands and, therefore, multiple bytes of data can be written to sequential registers after each Slave ACK as shown in Sequence 2 on the following page.

Reading from a KXTF9 8-bit Register

When reading data from a KXTF9 8-bit register on the I²C bus, as shown in Sequence 3 on the next page, the following protocol must be observed: The Master first transmits a start condition (S) and the appropriate Slave Address (SAD) with the LSB set at '0' to write. The KXTF9 acknowledges and the Master transmits the 8-bit RA of the register it wants to read. The KXTF9 again acknowledges, and the Master transmits a repeated start condition (Sr). After the repeated start condition, the Master addresses the KXTF9 with a '1' in the LSB (SAD+R) to read from the previously selected register. The Slave then acknowledges and transmits the data from the requested register. The Master does not acknowledge (NACK) it received the transmitted data, but transmits a stop condition to end the data transfer. Note that the KXTF9 automatically increments through its sequential registers, allowing data to be read from multiple registers following a single SAD+R command as shown below in Sequence 4 on the following page.

If a receiver cannot transmit or receive another complete byte of data until it has performed some other function, it can hold SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases SCL.

Data Transfer Sequences

The following information clearly illustrates the variety of data transfers that can occur on the I²C bus and how the Master and Slave interact during these transfers. Table 7 defines the I²C terms used during the data transfers.

Term	Definition
S	Start Condition
Sr	Repeated Start Condition
SAD	Slave Address
W	Write Bit
R	Read Bit
ACK	Acknowledge
NACK	Not Acknowledge
RA	Register Address
Data	Transmitted/Received Data
P	Stop Condition

Table 7. I²C Terms

Sequence 1. The Master is writing one byte to the Slave.

Master	S	SAD + W		RA		DATA		P
Slave			ACK		ACK		ACK	

Sequence 2. The Master is writing multiple bytes to the Slave.

Master	S	SAD + W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

Sequence 3. The Master is receiving one byte of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			NACK	P
Slave			ACK		ACK			ACK	DATA		

Sequence 4. The Master is receiving multiple bytes of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			ACK		NACK	P
Slave			ACK		ACK			ACK	DATA		DATA

KXTF9 Register Descriptions

Accelerometer Outputs

These registers contain up to 12-bits of valid acceleration data for each axis depending on the setting of the RES bit in CTRL_REG1, where the acceleration outputs are represented in 12-bit valid data when RES = '1' and 8-bit valid data when RES = '0'. The data is updated every user-defined ODR period, is protected from overwrite during each read, and can be converted from digital counts to acceleration (g) per Figure 9. The register acceleration output binary data is represented in 2's complement format. For example, if N = 12 bits, then the Counts range is from -2048 to 2047, and if N = 8 bits, then the Counts range is from -128 to 127.

12-bit Register Data (2's complement)	Equivalent Counts in decimal	Range = +/-2g	Range = +/-4g	Range = +/-8g
0111 1111 1111	2047	+1.999g	+3.998g	+7.996g

DCST_RESP

This register can be used to verify proper integrated circuit functionality. It always has a byte value of 0x55h unless the DCST bit in CTRL_REG3 is set. At that point this value is set to 0xAAh. The byte value is returned to 0x55h after reading this register.

R	R	R	R	R	R	R	R	
DCSTR7	DCSTR6	DCSTR5	DCSTR4	DCSTR3	DCSTR2	DCSTR1	DCSTR0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	01010101

I²C Address: 0x0Ch

WHO_I_AM

This register can be used for supplier recognition, as it can be factory written to a known byte value. The default value is 0x01h.

R	R	R	R	R	R	R	R	
WIA7	WIA6	WIA5	WIA4	WIA3	WIA2	WIA1	WIA0	Reset Value

Tilt Position Registers

These two registers report previous and current position data that is updated at the user-defined ODR frequency and is protected during register read. Table 9 describes the reported position for each bit value.

TILT_POS_CUR

Current tilt position register

R	R	R	R	R	R	R	R	Reset Value
0	0	LE	RI	DO	UP	FD	FU	00100000
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	

I²C Address: 0x10h

TILT_POS_PRE

Previous tilt position register

R	R	R	R	R	R	R	R	Reset Value
0	0	LE	RI	DO	UP	FD	FU	00100000
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	

I²C Address: 0x11h

Bit	Description
LE	Left State (X-)
RI	Right State (X+)
DO	Down State (Y-)
UP	Up State (Y+)
FD	Face-Down State (Z-)
FU	Face-Up State (Z+)

Interrupt Source Registers

These two registers report function state changes. This data is updated when a new state change or event occurs and each applications result is latched until the interrupt release register is read. The motion interrupt bit WUFS can be configured to report data in an unlatched manner via the interrupt control registers.

INT_SRC_REG1

This register reports which axis and direction detected a single or double tap event, per Table 10.

R	R	R	R	R	R	R	R
0	0	TLE	TRI	TDO	TUP	TFD	TFU
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

I²C Address: 0x15h

Bit	Description
TLE	X Negative (X-) Reported
TRI	X Positive (X+) Reported
TDO	Y Negative (Y-) Reported
TUP	Y Positive (Y+) Reported
TFD	Z Negative (Z-) Reported
TFU	Z Positive (Z+) Reported

Table 10. KXTF9 Directional Tap™ Reporting

INT_SRC_REG2

This register reports which function caused an interrupt. Reading from the interrupt release register will clear the entire contents of this register.

R	R	R	R	R	R	R	R
0	0	0	DRDY	TDTS1	TDTS0	WUFS	TPS
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

I²C Address: 0x16h

DRDY indicates that new acceleration data is available. This bit is cleared when acceleration data is read or the interrupt release register is read.

DRDY = 0 – new acceleration data not available

DRDY = 1 – new acceleration data available

± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications

PART NUMBER:

**KXTF9-4100
Rev. 6
Jun-2011**

***TDTS1, TDTS0** indicates whether a single or double-tap event was detected per Table 11.*

TDTS1	TDTS0	Event
0	0	No Tap
0	1	Single Tap
1	0	Double Tap
1	1	DNE

Table 11. Directional Tap™ Event Description

***TPS** reflects the status of the tilt position function.
 TPS = 0 – tilt position state has not changed
 TPS = 1 – tilt position state has changed*

STATUS_REG

This register reports the status of the interrupt.

R	R	R	R	R	R	R	R
0	0	0	INT	0	0	0	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

I²C Address: 0x18h

***INT** reports the combined interrupt information of all enabled functions. This bit is released to 0 when the interrupt source latch register (1Ah) is read.
 INT = 0 – no interrupt event
 INT = 1 – interrupt event has occurred*

± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications

PART NUMBER:

**KXTF9-4100
Rev. 6
Jun-2011**

INT_REL

Latched interrupt source information (INT_SRC_REG1 and INT_SRC_REG2), the status register, and the physical interrupt pin (7) are cleared when reading this register.

R	R	R	R	R	R	R	R
X	X	X	X	X	X	X	X
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

I²C Address: 0x1Ah

CTRL_REG1

Read/write control register that controls the main feature set.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Reset Value
PC1	RES	DRDYE	GSEL1	GSEL0	TDTE	WUFE	TPE	00000000
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	

I²C Address: 0x1Bh

PC1 controls the operating mode of the KXTF9.

PC1 = 0 - stand-by mode

PC1 = 1 – operating mode

RES determines the performance mode of the KXTF9. Note that to change the value of this bit, the PC1 bit must first be set to “0”.

RES = 0 – low current, 8-bit valid

RES = 1- high current, 12-bit valid

DRDYE enables the reporting of the availability of new acceleration data on the interrupt.

Note that to change the value of this bit, the PC1 bit must first be set to “0”.

DRDYE = 0 – availability of new acceleration data not reflected on interrupt pin (7)

DRDYE = 1- availability of new acceleration data reflected on interrupt pin (7)
