

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

GENERAL DESCRIPTION

The F2258 is a low insertion loss **V**oltage **V**ariable RF **A**ttenuator (VVA) designed for a multitude of wireless and other RF applications. This device covers a broad frequency range from 50 MHz to 6000 MHz. In addition to providing low insertion loss, the F2258 provides excellent linearity performance over its entire voltage control and attenuation range.

The F2258 uses a single positive supply voltage of 3.15 V to 5.25 V. Another feature includes multi-directional operation meaning the RF input can be applied to either RF1 or RF2 pins. Control voltage ranges from 0 V to 3.6 V.

COMPETITIVE ADVANTAGE

F2258 provides extremely low insertion loss and superb IP3, IP2, Return Loss and Slope Linearity across the control range. Comparing to the previous state-of-the-art for silicon VVAs this device is better as follows:

- ✓ Insertion Loss:
 - @ 2000 MHz: 1.4 dB vs. 2.8 dB
 - @ 6000 MHz: 2.7 dB vs. 7.0 dB
- ✓ Maximum Attenuation Slope: 33 dB/Volt vs. 53 dB/Volt
- ✓ Minimum Return Loss up to 6000 MHz: 12.5 dB vs. 7 dB
- ✓ Minimum Output IP3: 31 dBm vs. 15 dBm
- ✓ Minimum Input IP2: 87 dBm vs. 80 dBm
- ✓ Maximum Operating Temperature: +105 °C vs. +85 °C

APPLICATIONS

- Base Station 2G, 3G, 4G,
- Portable Wireless
- Repeaters and E911 systems
- Digital Pre-Distortion
- Point to Point Infrastructure
- Public Safety Infrastructure
- Satellite Receivers and Modems
- WIMAX Receivers and Transmitters
- Military Systems, JTRS radios
- RFID handheld and portable readers
- Cable Infrastructure
- Wireless LAN
- Test / ATE Equipment

FEATURES

- Low Insertion Loss: 1.4 dB @ 2000 MHz
- Typical / Min IIP3: 65 dBm / 47 dBm
- Typical / Min IIP2: 95 dBm / 87 dBm
- 33.6 dB Attenuation Range
- Bi-directional RF ports
- +34.4 dBm Input P1dB compression
- Linear-in-dB attenuation characteristic
- Supply voltage: 3.15 V to 5.25 V
- V_{CTRL} range: 0 V to 3.6 V using 5 V supply
- +105 °C max operating temperature
- 3 mm x 3 mm, 16-pin QFN package

Note 2: Items in min/max columns that are not bold/italics are Guaranteed by Design Characterization.

Note 3: The input 1dB compression point is a linearity figure of merit. Refer to Absolute Maximum Ratings section along with Figure 1 for the maximum RF input power vs. RF frequency.

Note 4: Set blocking capacitors C1 & C2 to 0.01 μF to achieve best return loss performance at 50 MHz.

TYPICAL OPERATING CONDITIONS (TOC)

Unless otherwise noted for the TOC graphs on the following pages, the following conditions apply.

- **$V_{DD} = +3.3 \text{ V}$ or $+5.0 \text{ V}$**
- **$T_{CASE} = +25 \text{ }^{\circ}\text{C}$**
- **$F_{RF} = 2000 \text{ MHz}$**
- **RF trace and connector losses are de-embedded for S-parameters**
- **$P_{in} = 0 \text{ dBm}$ for all small signal tests**
- **$P_{in} = +20 \text{ dBm}$ for single tone linearity tests (RF1 port driven)**
- **$P_{in} = +20 \text{ dBm/tone}$ for two tone linearity tests (RF1 port driven)**
- **Two tone frequency spacing = 50 MHz**

PIN DIAGRAM

PIN DESCRIPTION

Pin	Name	Function
4, 9	GND	Ground these pins as close to the device as possible.
3	RF2	RF Port 2. Matched to 50 ohms. Must use an external AC coupling capacitor as close to the device as possible. For low frequency operation increase the capacitor value to result in a low reactance at the frequency of interest.
5	V _{DD}	Power supply input. Bypass to GND with capacitors close as possible to pin.
1, 2, 6, 8, 11, 12, 13, 14, 15, 16	NC	No internal connection. These pins can be left unconnected or connected to ground.
7	V _{CTRL}	Attenuator control voltage. Apply a voltage in the range as specified in the Operating Conditions Table. See application section for details about V _{CTRL} .
10	RF1	RF Port 1. Matched to 50 ohms. Must use an external AC coupling capacitor as close to the device as possible. For low frequency operation increase the capacitor value to result in a low reactance at the frequency of interest.
—	EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to achieve the specified RF performance.

APPLICATIONS INFORMATION

Default Start-up

The V_{CTRL} pin has an internal pull-down resistor. If left floating, the part will power up in the minimum attenuation state.

V_{CTRL}

The V_{CTRL} pin is used to control the attenuation of the F2258. With $V_{DD} = 5\text{ V}$ the control range of V_{CTRL} is from 0 V (minimum attenuation) to 3.6 V (maximum attenuation). For other settings of V_{DD} refer to the Operating Conditions Table. Apply V_{DD} before applying voltage to the V_{CTRL} pin to prevent damage to the on-chip pull-up ESD diode. If this sequencing is not possible, then set resistor R2 to 1k Ω to limit the current into the V_{CTRL} pin.

RF1 and RF2 Ports

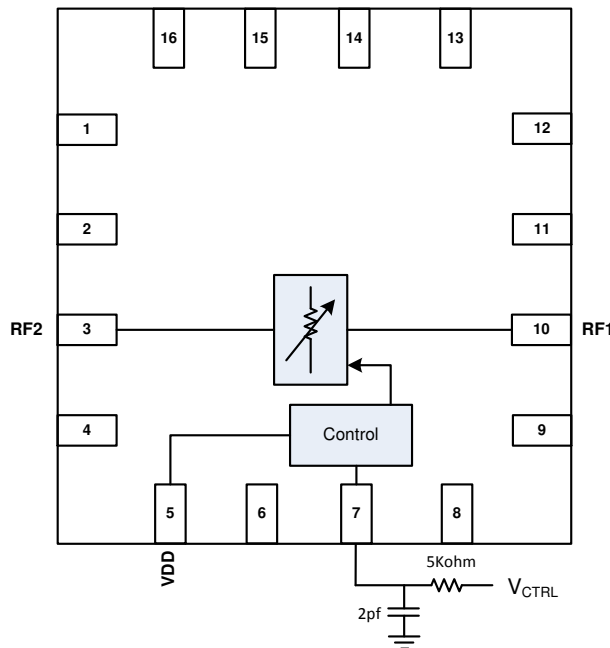

The F2258 is a bi-directional device thus allowing RF1 or RF2 to be used as the RF input. As displayed in the Typical Operating Conditions curves, RF1 shows enhanced linearity. V_{DD} must be applied prior to the application of RF power to ensure reliability. DC blocking capacitors are required on the RF pins and should be set to a value that results in a low reactance over the frequency range of interest.

Power Supplies

The supply pin should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than 1V/20 μ S. In addition, all control pins should remain at 0V (+/-0.3V) while the supply voltage ramps or while it returns to zero.

Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of control pin 7 is recommended as shown below.
