Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

FAN54015
USB-Compliant Single-Cell Li-Ion Switching Charger with USB-OTG Boost Regulator

Features

- Fully Integrated, High-Efficiency Charger for Single-Cell Li-Ion and Li-Polymer Battery Packs
- Faster Charging than Linear
- Charge Voltage Accuracy: ±0.5% at 25°C
±1% from 0 to 125°C
- ±5% Input Current Regulation Accuracy
- ±5% Charge Current Regulation Accuracy
- 20 V Absolute Maximum Input Voltage
- 6 V Maximum Input Operating Voltage
- 1.45 A Maximum Charge Rate
- Programmable through High-Speed I^2C Interface (3.4 Mb/s) with Fast Mode Plus Compatibility
  - Input Current
  - Fast-Charge / Termination Current
  - Charger Voltage
  - Termination Enable
- 3 MHz Synchronous Buck PWM Controller with Wide Duty Cycle Range
- Small Footprint 1 μH External Inductor
- Safety Timer with Reset Control
- 1.8 V Regulated Output from VBUS for Auxiliary Circuits
- Dynamic Input Voltage Control
- Low Reverse Leakage to Prevent Battery Drain to VBUS
- 5 V, 500 mA Boost Mode for USB OTG for 3.0 V to 4.5 V Battery Input
- Available in a 1.96 x 1.87 mm, 20-bump, 0.4 mm Pitch WLCSP Package

Applications

- Cell Phones, Smart Phones, PDAs
- Tablet, Portable Media Players
- Gaming Device, Digital Cameras

Description

The FAN54015 combines a highly integrated switch-mode charger, to minimize single-cell Lithium-ion (Li-ion) charging time from a USB power source, and a boost regulator to power a USB peripheral from the battery.

The charging parameters and operating modes are programmable through an I^2C Interface that operates up to 3.4 Mbps. The charger and boost regulator circuits switch at 3 MHz to minimize the size of external passive components.

The FAN54015 provides battery charging in three phases: conditioning, constant current and constant voltage.

To ensure USB compliance and minimize charging time, the input current limit can be changed through the I^2C by the host processor. Charge termination is determined by a programmable minimum current level. A safety timer with reset control provides a safety backup for the I^2C host. Charge status is reported to the host through the I^2C port.

The integrated circuit (IC) automatically restarts the charge cycle when the battery falls below an internal threshold. If the input source is removed, the IC enters a high-impedance mode, preventing leakage from the battery to the input. Charge current is reduced when the die temperature reaches 120°C, protecting the device and PCB from damage.

The FAN54015 can operate as a boost regulator on command from the system. The boost regulator includes a soft-start that limits inrush current from the battery and uses the same external components used for charging the battery.

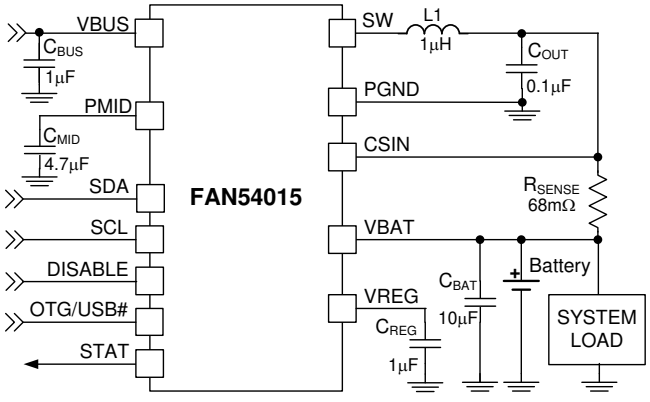

Figure 1. Typical Application

Ordering Information

Part Number	Temperature Range	Package	PN Bits: IC_INFO[4:2]	Packing Method
FAN54015UCX	-40 to 85°C	20-Bump, Wafer-Level Chip-Scale Package (WLCSP), 0.4 mm Pitch, Estimated Size: 1.96 x 1.87 mm	101	Tape and Reel
FAN54015BUCX(1)				

Note:
1. FAN54015BUCX includes backside lamination.

Table 1. Feature Summary

Part Number	Slave Address	Automatic Charge	Special Charger(2)	Safety Limits	Battery Absent Behavior	E2 Pin	VREG (E3 Pin)
FAN54015UCX	1101010	Yes	Yes	Yes	ON	DISABLE	1.8 V

Note:
2. A “special charger” is a current-limited charger that is not a USB compliant source.

Block Diagram

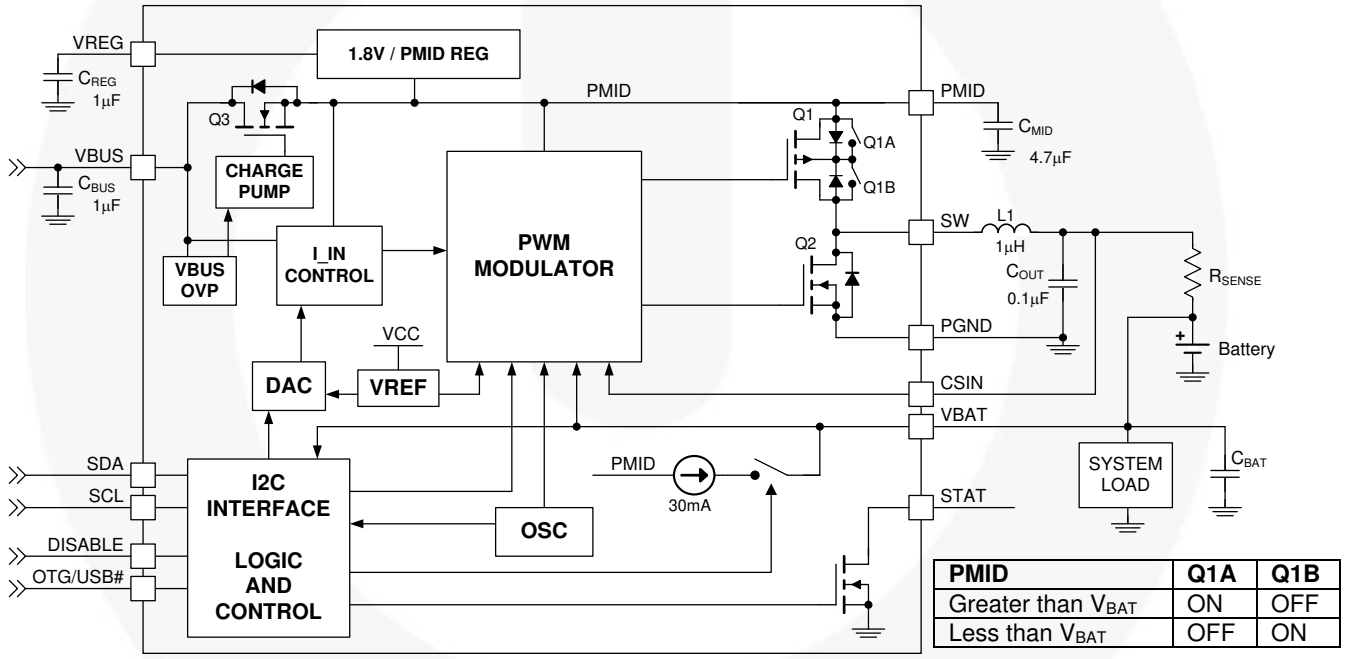

Figure 2. IC and System Block Diagram

Table 2. Recommended External Components

Component	Description	Vendor	Parameter	Typ.	Unit
L1	1 µH ±20%, 1.6 A, DCR=55 mΩ, 2520	Murata: LQM2HPN1R0	L	1.0	µH
	1 µH ±30%, 1.4 A, DCR=85 mΩ, 2016	Murata: LQM2MPN1R0			
C_{BAT}	10 µF, 20%, 6.3 V, X5R, 0603	Murata: GRM188R60J106M TDK: C1608X5R0J106M	C	10	µF
C_{MID}	4.7 µF, 10%, 6.3 V, X5R, 0603	Murata: GRM188R60J475K TDK: C1608X5R0J475K	C(3)	4.7	µF
C_{BUS}	1.0 µF, 10%, 25 V, X5R, 0603	Murata GRM188R61E105K TDK:C1608X5R1E105M	C	1.0	µF

Note:
3. A 6.3 V rating is sufficient for C_{MID} because PMID is protected from over-voltage surges on VBUS by Q3 (Figure 2).

Pin Configuration

Figure 3. WLCSP-20 Pin Assignments

Pin Definitions

Pin #	Name	Description
A1, A2	VBUS	**Charger Input Voltage** and USB-OTG output voltage. Bypass with a 1 μF capacitor to PGND.
A3	NC	**No Connect**. No external connection is made between this pin and the IC's internal circuitry.
A4	SCL	**I²C Interface Serial Clock**. This pin should not be left floating.
B1-B3	PMID	**Power Input Voltage**. Power input to the charger regulator, bypass point for the input current sense, and high-voltage input switch. Bypass with a minimum of 4.7 μF, 6.3 V capacitor to PGND.
B4	SDA	**I²C Interface Serial Data**. This pin should not be left floating.
C1-C3	SW	**Switching Node**. Connect to output inductor.
C4	STAT	**Status**. Open-drain output indicating charge status. The IC pulls this pin LOW when charging.
D1-D3	PGND	**Power Ground**. Power return for gate drive and power transistors. The connection from this pin to the bottom of C_{MID} should be as short as possible.
D4	OTG	**On-The-Go**. Enables boost regulator in conjunction with OTG_EN and OTG_PL bits *(see Table 16)*. On VBUS Power-On Reset (POR), this pin sets the input current limit for t_{15MIN} charging.
E1	CSIN	**Current-Sense Input**. Connect to the sense resistor in series with the battery. The IC uses this node to sense current into the battery. Bypass this pin with a 0.1 μF capacitor to PGND.
E2	DISABLE	**Charge Disable**. If this pin is HIGH, charging is disabled. When LOW, charging is controlled by the I²C registers. When this pin is HIGH, the 15-minute timer is reset. This pin does not affect the 32-second timer.
E3	VREG	**Regulator Output**. Connect to a 1 μF capacitor to PGND. This pin can supply up to 2mA of DC load current. The output voltage is PMID, which is limited to 1.8 V.
E4	VBAT	**Battery Voltage**. Connect to the positive (+) terminal of the battery pack. Bypass with a 0.1 μF capacitor to PGND if the battery is connected through long leads.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter		Min.	Max.	Unit
V_{BUS}	VBUS Voltage	Continuous	–1.4	20.0	V
		Pulsed, 100 ms Maximum Non-Repetitive	–2.0		
V_{STAT}	STAT Voltage		–0.3	16.0	V
V_I	PMID Voltage			7.0	V
	SW, CSIN, VBAT, DISABLE Voltage		–0.3	7.0	
V_O	Voltage on Other Pins		–0.3	6.5[4]	V
$\frac{dV_{BUS}}{dt}$	Maximum V_{BUS} Slope above 5.5 V when Boost or Charger are Active			4	V/µs
ESD	Electrostatic Discharge Protection Level	Human Body Model per JESD22-A114	2000		V
		Charged Device Model per JESD22-C101	500		
T_J	Junction Temperature		–40	+150	°C
T_{STG}	Storage Temperature		–65	+150	°C
T_L	Lead Soldering Temperature, 10 Seconds			+260	°C

Note:

4. Lesser of 6.5 V or V_I + 0.3 V.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter		Min.	Max.	Unit
V_{BUS}	Supply Voltage		4	6	V
$V_{BAT(MAX)}$	Maximum Battery Voltage when Boost enabled			4.5	V
$-\frac{dV_{BUS}}{dt}$	Negative VBUS Slew Rate during VBUS Short Circuit, $C_{MID} \leq 4.7$ µF *(see VBUS Short While Charging)*	$T_A \leq 60°C$		4	V/µs
		$T_A \geq 60°C$		2	
T_A	Ambient Temperature		–30	+85	°C
T_J	Junction Temperature *(see Thermal Regulation and Protection section)*		–30	+120	°C

Thermal Properties

Junction-to-ambient thermal resistance is a function of application and board layout. This data is measured with four-layer 2s2p boards in accordance to JEDEC standard JESD51. Special attention must be paid not to exceed junction temperature $T_{J(max)}$ at a given ambient temperature T_A. *For measured data, see Table 11.*

Symbol	Parameter	Typical	Unit
θ_{JA}	Junction-to-Ambient Thermal Resistance	60	°C/W
θ_{JB}	Junction-to-PCB Thermal Resistance	20	°C/W

Electrical Specifications

Unless otherwise specified: according to the circuit of Figure 1; recommended operating temperature range for T_J and T_A; V_{BUS}=5.0 V; HZ_MODE; OPA_MODE=0; (Charge Mode); SCL, SDA, OTG=0 or 1.8 V; and typical values are for T_J=25°C.

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
Power Supplies						
I_{VBUS}	VBUS Current	$V_{BUS} > V_{BUS(min)}$, PWM Switching		10		mA
		$V_{BUS} > V_{BUS(min)}$; PWM Enabled, Not Switching (Battery OVP Condition); I_IN Setting=100 mA		2.5		mA
		0°C < T_J < 85°C, HZ_MODE=1 $V_{BAT} < V_{LOWV}$, 32S Mode		63	90	µA
I_{LKG}	VBAT to VBUS Leakage Current	0°C < T_J < 85°C, HZ_MODE=1, V_{BAT}=4.2 V, V_{BUS}=0 V		0.2	5.0	µA
I_{BAT}	Battery Discharge Current in High-Impedance Mode	0°C < T_J < 85°C, HZ_MODE=1, V_{BAT}=4.2 V			20	µA
		DISABLE=1, 0°C < T_J < 85°C, V_{BAT}=4.2 V			10

Δt_{LF}	Low-Frequency Timer Accuracy	Charger Inactive	–25		25	%

Notes:

5. Negative current is current flowing from the battery to VBUS (discharging the battery).
6. Q2 always turns on for 60 ns, then turns off if current is below I_{SYNC}.
7. Guaranteed by design; not tested in production.
8. This tolerance (%) applies to all timers on the IC, including soft-start and deglitching timers.

I²C Timing Specifications

Guaranteed by design.

Circuit Description / Overview

When charging batteries with a current-limited input source, such as USB, a switching charger's high efficiency over a wide range of output voltages minimizes charging time.

FAN54015 combines a highly integrated synchronous buck regulator for charging with a synchronous boost regulator, which can supply 5 V to USB On-The-Go (OTG) peripherals. The regulator employs synchronous rectification for both the charger and boost regulators to maintain high efficiency over a wide range of battery voltages and charge states.

The FAN54015 has three operating modes:

1. Charge Mode:
   Charges a single-cell Li-ion or Li-polymer battery.
2. Boost Mode:
   Provides 5 V power to USB-OTG with an integrated synchronous rectification boost regulator using the battery as input.
3. High-Impedance Mode:
   Both the boost and charging circuits are OFF in this mode. Current flow from VBUS to the battery or from the battery to VBUS is blocked in this mode. This mode consumes very little current from VBUS or the battery.

Note: Default settings are denoted by **bold typeface**.

Charge Mode

In Charge Mode, FAN54015 employs four regulation loops:

1. Input Current: Limits the amount of current drawn from VBUS. This current is sensed internally and can be programmed through the I^2C interface.
2. Charging Current: Limits the maximum charging current. This current is sensed using an external R_{SENSE} resistor.
3. Charge Voltage: The regulator is restricted from exceeding this voltage. As the internal battery voltage rises, the battery's internal impedance and R_{SENSE} work in conjunction with the charge voltage regulation to decrease the amount of current flowing to the battery. Battery charging is completed when the voltage across R_{SENSE} drops below the I_{TERM} threshold.
4. Temperature: If the IC's junction temperature reaches 120°C, charge current is reduced until the IC's temperature stabilizes at 120°C.
5. An additional loop limits the amount of drop on VBUS to a programmable voltage (V_{SP}) to accommodate "special chargers" that limit current to a lower current than might be available from a "normal" USB wall charger.

Battery Charging Curve

If the battery voltage is below V_{SHORT}, a linear current source pre-charges the battery until V_{BAT} reaches V_{SHORT}. The PWM charging circuit is then started and the battery is charged with a constant current if sufficient input power is available. The current slew rate is limited to prevent overshoot.

The FAN54015 is designed to work with a current-limited input source at VBUS. During the current regulation phase of charging, I_{INLIM} or the programmed charging current limits the amount of current available to charge the battery and power the system. The effect of I_{INLIM} on I_{CHARGE} can be seen in Figure 34.

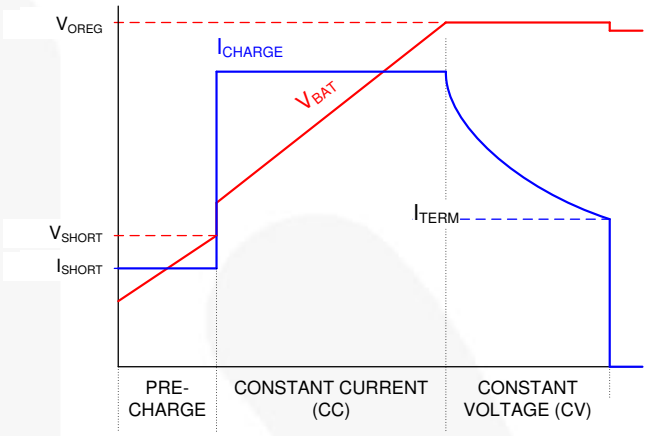

Figure 33. Charge Curve, I_{CHARGE} Not Limited by I_{INLIM}

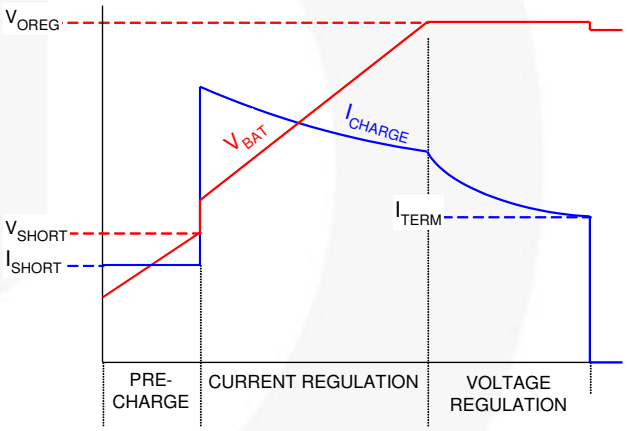

Figure 34. Charge Curve, I_{INLIM} Limits I_{CHARGE}

Assuming that V_{OREG} is programmed to the cell's fully charged "float" voltage, the current that the battery accepts with the PWM regulator limiting its output (sensed at VBAT) to V_{OREG} declines, and the charger enters the voltage regulation phase of charging. When the current declines to the programmed I_{TERM} value, the charge cycle is complete. Charge current termination can be disabled by resetting the TE bit (REG1[3]).

The charger output or "float" voltage can be programmed by the OREG bits from 3.5 V to 4.44 V in 2 0mV increments, as shown in Table 3.

Table 3. OREG Bits (OREG[7:2]) vs. Charger V_{OUT} (V_{OREG}) Float Voltage

Decimal	Hex	VOREG	Decimal	Hex	VOREG
0	00	3.50	32	20	4.14
1	01	3.52	33	21	4.16
2	**02**	**3.54**	34	22	4.18
3	03	3.56	35	23	4.20
4	04	3.58	36	24	4.22
5	05	3.60	37	25	4.24
6	06	3.62	38	26	4.26

15	0F	3.80	47	2F	4.44
16	10	3.82	48	30	4.44
17	11	3.84	49	31	4.44
18	12	3.86	50	32	4.44
19	13	3.88	51	33	4.44
20	14	3.90	52	34	4.44
21	15	3.92	53	35	4.44
22	16	3.94	54	36	4.44
23	17	3.96	55	37	4.44
24	18	3.98	56	38	4.44
25	19	4.00	57	39	4.44
26	1A	4.02	58	3A	4.44
27	1B	4.04	59	3B	4.44
28	1C	4.06	60	3C	4.44
29	1D	4.08	61	3D	4.44
30	1E	4.10	62	3E	4.44

The following charging parameters can be programmed by the host through I^2C:

Table 4. Programmable Charging Parameters

Parameter	Name	Register
Output Voltage Regulation	V_{OREG}	REG2[7:2]
Battery Charging Current Limit	I_{OCHRG}	REG4[6:4]
Input Current Limit	I_{INLIM}	REG1[7:6]
Charge Termination Limit	I_{TERM}	REG4[2:0]
Weak Battery Voltage	V_{LOWV}	REG1[5:4]

A new charge cycle begins when one of the following occurs:

- The battery voltage falls below V_{OREG} - V_{RCH}
- VBUS Power on Reset (POR) clears and the battery voltage is below the weak battery threshold (V_{LOWV}).
- $\overline{CE}$ or HZ_MODE is reset through I^2C write to CONTROL1 (R1) register.

Charge Current Limit ($I_{OCHARGE}$)

Table 5. $I_{OCHARGE}$ (REG4 [6:4]) Current as Function of $I_{OCHARGE}$ Bits and R_{SENSE} Resistor Values

DEC	BIN	HEX	V_{RSENSE} (mV)	$I_{OCHARGE}$ (mA)	
				68 mΩ	100 mΩ
0	**000**	**00**	**37.4**	**550**	**374**
1	001	01	44.2	650	442
2	010	02	51.0	750	510
3	011	03	57.8	850	578
4	100	04	71.4	1050	714
5	101	05	78.2	1150	782
6	110	06	91.8	1350	918
7	111	07	98.6	1450	986

Termination Current Limit

Current charge termination is enabled when TE (REG1[3])=1. Typical termination current values are given in Table 6.

Table 6. I_{TERM} Current as Function of I_{TERM} Bits (REG4[2:0]) and R_{SENSE} Resistor Values

I_{TERM}	V_{RSENSE} (mV)	I_{TERM} (mA)	
		68 mΩ	100 mΩ
0	3.3	49	33
1	**6.6**	**97**	**66**
2	9.9	146	99
3	13.2	194	132
4	16.5	243	165
5	19.8	291	198
6	23.1	340	231
7	26.4	388	264

When the charge current falls below I_{TERM}, PWM charging stops and the STAT bits change to READY (00) for about 500 ms while the IC determines whether the battery and charging source are still connected. STAT then changes to CHARGE DONE (10), provided the battery and charger are still connected.

PWM Controller in Charge Mode

The IC uses a current-mode PWM controller to regulate the output voltage and battery charge currents. The synchronous rectifier (Q2) has a current limit that which off the FET when the current is negative by more than 140mA peak. This prevents current flow from the battery.

Safety Timer

Section references Figure 39.

At the beginning of charging, the IC starts a 15-minute timer (t_{15MIN}). When this times out, charging is terminated. Writing to any register through I^2C stops and resets the t_{15MIN} timer, which in turn starts a 32-second timer (t_{32S}). Setting the TMR_RST bit (REG0[7]) resets the t_{32S} timer. If the t_{32S} timer times out; charging is terminated, the registers are set to their default values, and charging resumes using the default values with the t_{15MIN} timer running.

Normal charging is controlled by the host with the t_{32S} timer running to ensure that the host is alive. Charging with the t_{15MIN} timer running is used for charging that is unattended by the host. If the t_{15MIN} timer expires; the IC turns off the charger, sets the $\overline{CE}$ bit, and indicates a timer fault (110) on the FAULT bits (REG0[2:0]). This sequence prevents overcharge if the host fails to reset the t_{32S} timer.

V_{BUS} POR / Non-Compliant Charger Rejection

When the IC detects that V_{BUS} has risen above $V_{IN(MIN)1}$ (4.4 V), the IC applies a 100 Ω load from VBUS to GND. To clear the VBUS POR (Power-On-Reset) and begin charging, VBUS must remain above $V_{IN(MIN)1}$ and below $VBUS_{OVP}$ for t_{VBUS_VALID} (30 ms) before the IC initiates charging. The VBUS validation sequence always occurs before charging is initiated or re-initiated (for example, after a VBUS OVP fault or a V_{RCH} recharge initiation).

t_{VBUS_VALID} ensures that unfiltered 50 / 60 Hz chargers and other non-compliant chargers are rejected.

USB-Friendly Boot Sequence

At VBUS POR, when the battery voltage is above the weak battery threshold (V_{LOWV}), the IC operates in accordance with its I^2C register settings. If $V_{BAT} < V_{LOWV}$, the IC sets all registers to their default values and enables the charger using an input current limit controlled by the OTG pin (100mA if OTG is LOW and 500 mA if OTG is HIGH). This feature can revive a battery whose voltage is too low to ensure reliable host operation. Charging continues in the absence of host communication even after the battery has reached V_{OREG}, whose default value is 3.54 V, and the charger remains active until t_{15MIN} times out. Once the host processor begins writing to the IC, charging parameters are set by the host, which must continually reset the t_{32S} timer to continue charging using the programmed charging parameters. If t_{32S}.times out, the register defaults are loaded, the FAULT bits are set to 110, STAT is pulsed HIGH, and charging continues with default charge parameters.

Input Current Limiting

To minimize charging time without overloading VBUS current limitations, the IC's input current limit can be programmed by the I_{INLIM} bits (REG1[7:6]).

Table 7. Input Current Limit

I_{INLIM} REG1[7:6]	Input Current Limit
00	**100 mA**
01	500 mA
10	800 mA
11	No limit

The OTG pin establishes the input current limit when t_{15MIN} is running.

Special Charger

The FAN54015 has additional functionality to limit input current in case a current-limited "special charger" is supplying VBUS. These slowly increase the charging current until either:

- I_{INLIM} or $I_{OCHARGE}$ is reached

or

- V_{BUS}=V_{SP}.

If V_{BUS} collapses to V_{SP} when the current is ramping up, the FAN54015 charge with an input current that keeps V_{BUS}=V_{SP}. When the V_{SP} control loop is limiting the charge current, the SP bit (REG5[4]) is set.

Table 8. V_{SP} as Function of SP Bits (REG5[2:0])

SP (REG5[2:0])			
DEC	**BIN**	**HEX**	**V_{SP}**
0	000	00	4.213
1	001	01	4.293
2	010	02	4.373
3	011	03	4.453
4	**100**	**04**	4.533
5	101	05	4.613
6	110	06	4.693
7	111	07	4.773

Safety Settings

FAN54015 contain a SAFETY register (REG6) that prevents the values in OREG (REG2[7:2]) and IOCHARGE (REG4[6:4]) from exceeding the values of the VSAFE and ISAFE values.

After V_{BAT} exceeds V_{SHORT}, the SAFETY register is loaded with its default value and may be written only before any other register is written. The entire desired Safety register value should be written twice to ensure the register bits are set. After writing to any other register, the SAFETY register is locked until V_{BAT} falls below V_{SHORT}.

The ISAFE (REG6[6:4]) and VSAFE (REG6[3:0]) registers establish values that limit the maximum values of $I_{OCHARGE}$ and V_{OREG} used by the control logic. If the host attempts to write a value higher than VSAFE or ISAFE to OREG or IOCHARGE, respectively; the VSAFE, ISAFE value appears as the OREG, IOCHARGE register value, respectively.

Table 9. I_{SAFE} ($I_{OCHARGE}$ Limit) as Function of ISAFE Bits (REG6[6:4])

ISAFE (REG6[6:4])					
DEC	**BIN**	**HEX**	**V_{RSENSE} (mV)**	**I_{SAFE} (mA)**	
				68 mΩ	**100 mΩ**
0	000	00	37.4	550	374
1	001	01	44.2	650	442
2	010	02	51.0	750	510
3	011	03	57.8	850	578

15	1111	0F	110010	4.44

Thermal Regulation and Protection

When the IC's junction temperature reaches T_{CF} (about 120°C), the charger reduces its output current to 550 mA to prevent overheating. If the temperature increases beyond $T_{SHUTDOWN}$; charging is suspended, the FAULT bits are set to 101, and STAT is pulsed HIGH. In Suspend Mode, all timers stop and the state of the IC's logic is preserved. Charging resumes at programmed current after the die cools to about 120°C.

Additional θ_{JA} data points, measured using the FAN54015 evaluation board, are given in Table 11 (measured with T_A=25°C). Note that as power dissipation increases, the effective θ_{JA} decreases due to the larger difference between the die temperature and ambient.

Table 11. Evaluation Board Measured θ_{JA}

Power (W)	θ_{JA}
0.504	54°C/W
0.844	50°C/W
1.506	46°C/W

Charge Mode Input Supply Protection

Sleep Mode

When V_{BUS} falls below V_{BAT} + V_{SLP}, and V_{BUS} is above $V_{IN(MIN)}$, the IC enters Sleep Mode to prevent the battery from draining into VBUS. During Sleep Mode, reverse current is disabled by body switching Q1.

Input Supply Low-Voltage Detection

The IC continuously monitors VBUS during charging. If V_{BUS} falls below $V_{IN(MIN)}$, the IC:

1. Terminates charging
2. Pulses the STAT pin, sets the STAT bits to 11, and sets the FAULT bits to 011.

If V_{BUS} recovers above the $V_{IN(MIN)}$ rising threshold after time t_{INT} (about two seconds), the charging process is repeated. This function prevents the USB power bus from collapsing or oscillating when the IC is connected to a suspended USB port or a low-current-capable OTG device.

Input Over-Voltage Detection

When the V_{BUS} exceeds $VBUS_{OVP}$, the IC:

1. Turns off Q3
2. Suspends charging
3. Sets the FAULT bits to 001, sets the STAT bits to 11, and pulses the STAT pin.

When V_{BUS} falls about 150 mV below $VBUS_{OVP}$, the fault is cleared and charging resumes after V_{BUS} is revalidated *(see VBUS POR / Non-Compliant Charger Rejection)*.

VBUS Short While Charging

If VBUS is shorted with a very low impedance while the IC is charging with $I_{INLIMIT}$=100 mA, the IC may not meet datasheet specifications until power is removed. To trigger this condition, V_{BUS} must be driven from 5 V to GND with a high slew rate. Achieving this slew rate requires a 0 Ω short to the USB cable less than 10cm from the connector.

Charge Mode Battery Detection & Protection

VBAT Over-Voltage Protection

The OREG voltage regulation loop prevents V_{BAT} from overshooting the OREG voltage by more than 50 mV when the battery is removed. When the PWM charger runs with no battery, the TE bit is not set and a battery is inserted that is charged to a voltage higher than V_{OREG}; PWM pulses stop. If no further pulses occur for 30 ms, the IC sets the FAULT bits to 100, sets the STAT bits to 11, and pulses the STAT pin.

Battery Detection During Charging

The IC can detect the presence, absence, or removal of a battery if the termination bit (TE) is set. During normal charging, once V_{BAT} is close to V_{OREG} and the termination charge current is detected, the IC terminates charging and sets the STAT bits to 10. It then turns on a discharge current, I_{DETECT}, for t_{DETECT}. If V_{BAT} is still above V_{OREG} – V_{RCH}, the battery is present and the IC sets the FAULT bits to 000. If V_{BAT} is below V_{OREG} – V_{RCH}, the battery is absent and the IC:

1. Sets the registers to their default values.
2. Sets the FAULT bits to 111.
3. Resumes charging with default values after t_{INT}.

Battery Short-Circuit Protection

If the battery voltage is below the short-circuit threshold (V_{SHORT}); a linear current source, I_{SHORT}, supplies V_{BAT} until V_{BAT} > V_{SHORT}.

System Operation with No Battery

The FAN54015 continues charging after VBUS POR with the default parameters, regulating the V_{BAT} line to 3.54 V until the host processor issues commands or the 15-minute timer expires. In this way, the FAN54015 can start the system without a battery.

The FAN54015 soft-start function can interfere with the system supply with battery absent. The soft-start activates whenever V_{OREG}, I_{INLIM}, or $I_{OCHARGE}$ are set from a lower to higher value. During soft-start, the I_{IN} limit drops to 100 mA for about 1ms unless I_{INLIM} is set to 11 (no limit). This could cause the system processor to fail to start. To avoid this behavior, use the following sequence.

1. Set the OTG pin HIGH. When VBUS is plugged in, I_{INLIM} is set to 500 mA until the system processor powers up and can set parameters through I^2C.
2. Program the Safety Register.
3. Set I_{INLIM} to 11 (no limit).
4. Set OREG to the desired value (typically 4.18).
5. Reset the IO_LEVEL bit, then set IOCHARGE.
6. Set I_{INLIM} to 500mA if a USB source is connected.

During the initial system startup, while the charger IC is being programmed, the system current is limited to 500mA for 1ms during steps 4 and 5. This is the value of the soft-start ICHARGE current used when I_{INLIM} is set to No Limit.

If the system is powered up without a battery present, the CV bit should be set. When a battery is inserted, the CV bit is cleared.

Charger Status / Fault Status

The STAT pin indicates the operating condition of the IC and provides a fault indicator for interrupt driven systems.

Table 12. STAT Pin Function

EN_STAT	Charge State	STAT Pin
0	X	OPEN
X	Normal Conditions	OPEN
1	Charging	LOW
X	Fault (Charging or Boost)	128μs Pulse, then OPEN
