

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (\_), the underscore (\_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (\_). Please check the ON Semiconductor website to verify the updated device numbers. The most current and up-to-date ordering information can be found at [www.onsemi.com](http://www.onsemi.com). Please email any questions regarding the system integration to [Fairchild\\_questions@onsemi.com](mailto:Fairchild_questions@onsemi.com).

## FDMF4061 – High Performance 60V Smart Power Stage Module

### Features

- Compact size – 6.0 mm x 7.5 mm PQFN
- High current handling: 25A
- Next Generation 60V Power MOSFETs:
  - Typ.  $R_{DS(on)}=2.4(\text{HS}) / 2.4(\text{LS}) \text{ m}\Omega$  at  $V_{GS}=10\text{V}$ ,  $I_D=25\text{A}$
- Wide driver power supply voltage range: 10V to 20V
- Internal pull-down resistors for PWM inputs (HI,LI)
- Short PWM propagation delays
- Under-voltage lockout (UVLO)
- Fully optimized system efficiency
- High performance low profile package
- Integrated 60V Half-Bridge gate driver
- Fairchild 60V PowerTrench® MOSFETs for clean switching waveforms and reduced ringing
- Low Inductance and low resistance packaging for minimal operating power losses
- Fairchild green packaging and RoHS compliant
- Reduced EMI due to low side flip-chip MOSFET

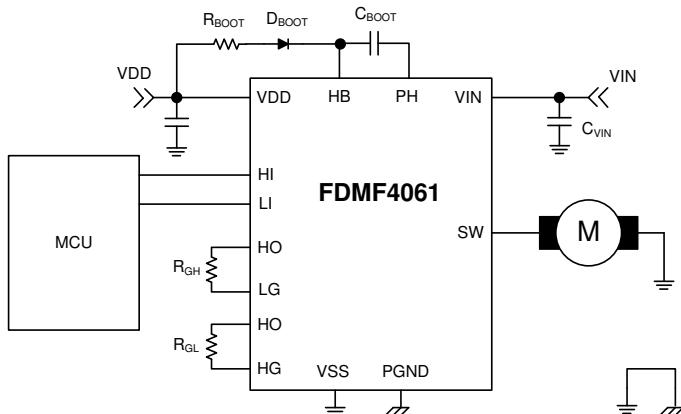

### General Description

The FDMF4061 is a compact 60V Smart Power Stage (SPS) module that is a fully optimized for use in high current switching applications. The FDMF4061 module integrates a driver IC plus two N-channel Power MOSFETs into a thermally enhanced, 6.0 mm x 7.5 mm PQFN package. The PQFN packaging provides very low package inductance and resistance improving the current handling capability and performance of the part. With an integrated approach, the complete switching power stage is optimized with regards to driver and MOSFET dynamic performance, system parasitic inductance, and Power MOSFET  $R_{DS(ON)}$ . The FDMF4061 uses Fairchild's high performance PowerTrench™ MOSFET technology, which reduces high voltage and current stresses in switching applications. The driver IC features a low delay times and matched PWM input propagation delays, which further enhance the performance of the part.

### Applications

- Motor Drives (Power tools & Drowns etc.)
- Telecom Half / Full - Bridge DC-DC converters
- Buck-Boost Converters
- High-current DC-DC Point of Load (POL) converters.

### Application Diagram

### Ordering Information

| Part Number | Current Rating [A] | Input Voltage [V] | Frequency Max [kHz] | Device Marking |
|-------------|--------------------|-------------------|---------------------|----------------|
| FDMF4061    | 25                 | 60                | 200                 | FDMF4061       |

## Pin Configuration

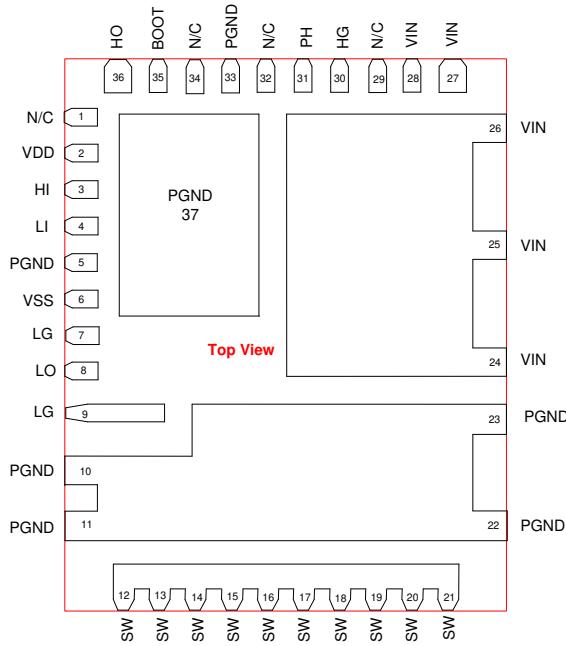

Figure 2. Pin Configuration (6.0mm x 7.5mm Package)

## Pin Definitions

| <b>Pin</b>                | <b>Name</b> | <b>Function</b>  |
|---------------------------|-------------|--|
| 1, 29, 32, 34             | N/C         | No connect   |
| 2                         | VDD         | Power supply input for low-side gate drive and bootstrap diode. Bypass this pin to VSS with a low impedance capacitor. |
| 3                         | HI          | High-side PWM input.   |
| 4                         | LI          | Low-side PWM input.  |
| 5, 10, 11, 22, 23, 33, 37 | PGND        | Power return for the power stage. Package header, pin 37 and PGND are internally fused (shorted).                      |
| 6                         | VSS         | Analog ground for driver IC analog circuits.   |
| 7, 9                      | LG          | Low-side MOSFET gate.  |
| 8                         | LO          | Low-side gate drive output.  |
| 12-21                     | SW          | Switching node junction between high-side and Low-side MOSFETs.  |
| 24-28                     | VIN         | Power input for the power stage. Bypass this pin to PGND with low impedance capacitor.                                 |
| 30                        | HG          | High-side MOSFET gate.   |
| 31                        | PH          | High-side source connection (SW node) for the bootstrap capacitor.   |
| 35                        | HB          | Bootstrap supply for high-side driver. Bypass this pin to PH with low impedance capacitor.                             |
| 36                        | HO          | High-side gate drive output.   |

## Absolute Maximum Ratings

The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table defines the conditions for actual device operation. Thermal resistance rating is measured under board mounted and still air conditions.

| Symbol           | Parameter  |                     | Min.            | Max.              | Unit |
|------------------|--|---------------------|-----------------|-------------------|------|
| $V_{IN}$         | Power Stage Supply Voltage                                 | Referenced to VSS   | -0.3            | 60                | V    |
| $V_{PH}$         | PH Voltage   | Referenced to VSS   | $V_{HB}-25$     | $V_{HB}+0.3$      | V    |
| $V_{DD}$         | Driver Supply Voltage                                      | Referenced to VSS   | -0.3            | 25                | V    |

## Functional Description

The FDMF4061 is a non-inverting 60V half-bridge Smart Power Stage (SPS) module. The module packages a driver IC die along with pair of equally sized (matched  $R_{DS(ON)}$ ) 60V PowerTrench<sup>TM</sup> N-Channel MOSFETs (Standard gate thresholds refer to **Table 5**).

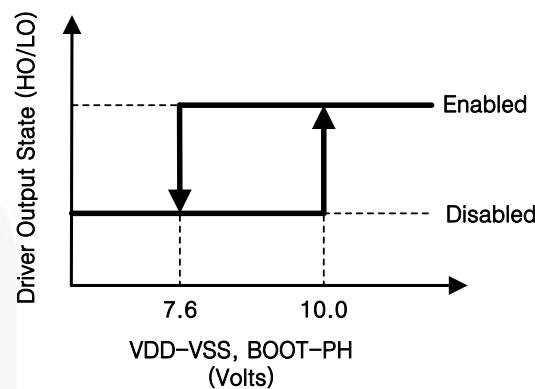

The FDMF4061 module provides separate power input pins; the power stage input (VIN) and the gate driver input (VDD). The power stage input (VIN) accepts a wide operating from 3V to 50V, while the gate driver input (VDD) requires 10V to 20V. The module accepts TTL compatible inputs (HI/LI) along with anti-cross conduction circuitry to protect against over-lapping PWM (HI/LI) pulses. The module (driver IC) also implements UVLO circuitry in both the VDD-VSS and BOOT-PH power domains.

### Power-Up and UVLO Operation

UVLO circuits are implemented in both the VDD-VSS and HB-PH power domains. During power-up, the VDD-VSS UVLO circuit forces HO and LO low until the VDD supply voltage exceeds the UVLO rising threshold (9.2V typ.). The module (driver IC) will begin responding to PWM pulses once VDD exceeds the UVLO threshold. The UVLO circuit does contain hysteresis (~0.6V) to prevent noise from interfering with normal operation. An additional UVLO circuit is implemented on the HB-PH pins which will hold HO low until HB-PH > (9.2V typ.). The HB-PH UVLO also incorporates hysteresis (~0.6V).

| VDD UVLO | BOOT UVLO | Driver State               |
|----------|-----------|----------------------------|
| 0        | X         | Disabled (GH, GL=0)        |
| 1        | 0         | GL follows PWM , GH=0      |
| 1        | 1         | Enabled (GH/GL follow PWM) |

**Table 6. UVLO Truth Table**

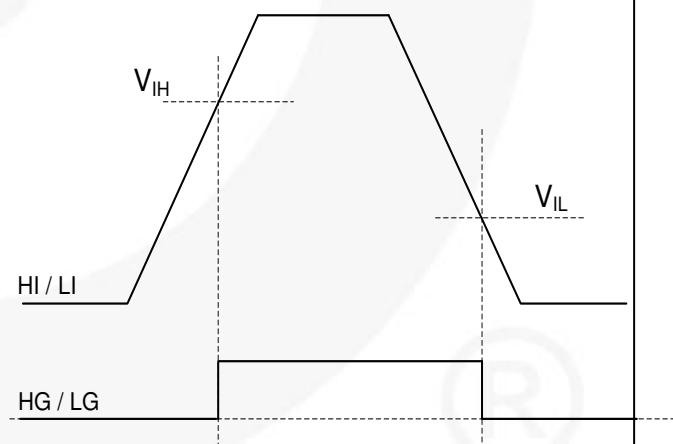

**Figure 62. Min/Max UVLO thresholds**

### PWM Input Stage

The FDMF4061 incorporates a PWM input gate drive design, where the low side drive output (LO) and high side drive output (HO) are controlled through independent PWM inputs (LI and HI, respectively).

The module (driver IC) can be used with TTL compatible input signals. The input signals can also be driven with voltage levels that are lower than the VDD supply level. The VDD supply level does NOT affect the input threshold levels (VIH and VIL).

**Figure 63. PWM threshold definitions**

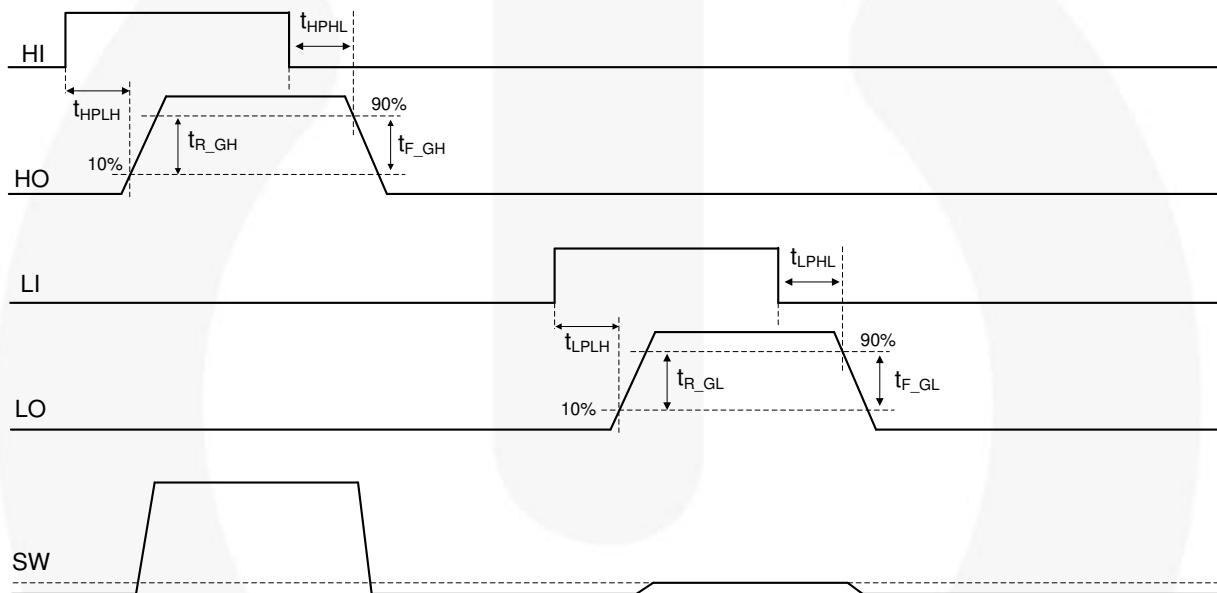

- $V_{IH}$  = PWM trip level to flip state from LOW to HIGH.
- $V_{IL}$  = PWM trip level to flip state from HIGH to LOW.

## Driver Output Stage

The driver IC output stage is designed to drive a pair of N-channel MOSFETs. The driver outputs (LO, HO) are non-inverting and will follow the PWM input commands (LI, HI respectively). The LO and HO outputs are capable of sinking and sourcing up to 0.65/0.35A peak current respectively.

The driver output stage is also capable of providing a rail (VDD) to rail (VSS) output voltage level when driving the Power MOSFETs. Depending on the end application, the output voltage level can be set to aide in optimizing MOSFET and driver IC power losses. The driver output voltage level can also be used to help adjust SW node edge rates.

## Timing Diagram

**Figure 64. PWM Timing Diagram (LI / HI signals)**

## Application Information:

The FDMF4061 is designed as a non-inverting power stage, where the Power MOSFET response (SW node) is designed to follow to HI/LI commands. The device is well-suited to be used in a wide variety of applications, such as: Half and Full-Bridge DC-DC converters, Active Clamp Forward converters, rectifier circuits, and motor drive power stages. However, various applications and topologies can place unique stresses on the module. There are a few basic power-stage requirements needed to ensure proper operation.

### Module Power Dissipation

As previously mentioned, the FDMF4061 is a multi-chip module (MCM). The module consists of three die (HS MOSFET, LS MOSFET and driver IC). Each die dissipates heat in normal operation resulting from power loss. The power MOSFETs can generate power loss from conduction and switching losses while the driver IC dissipates loss from bias, boot diode conduction and from the driver output stage sinking and sourcing power MOSFET gate currents and operating frequency. The amount of heat dissipated by any die is largely dependent on the operating conditions. The close physical placement of the three die inside of the package translates into strong thermal coupling between die. Ideally, a thermal camera should be used to monitor the FDMF4061 during the engineering development phase. This can help ensure the module operates within the absolute maximum ratings specified in this datasheet.

### Operating Modes

The FDMF4061 can reliably operate while driving various load impedances. However, the relatively large number of applications can result in the module operating in various modes. Common applications such as switching power converters and motor drives can place the FDMF4061 into different operating modes. The various operating modes will change the response of the MOSFET voltage and current stresses and power losses as well as the gate driver dead time response. A few operating modes are listed below.

### H-bridge Motor Drive

In this operating mode, it allows bi-directional current flow through motor by enabling diagonal MOSFETs to make current flow in one or the other direction. Inductor current will not tolerate abrupt changes either when charged or discharged and alternate path is required to protect switches during dead-time. The path can be made either MOSFET body-diode conducting as soon as switches are disabled or enabling opposite high-side or low-side switch to carry the recirculation current while avoiding shoot-through. Utilizing MOSFET channel is often much more efficient way to handle the decaying current due to lower conduction power loss than body-diode forward drop loss.

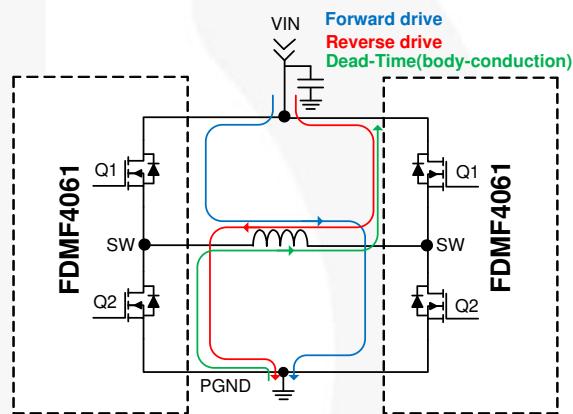

Figure 65. H-bridge motor drive

### FDMF4061 Power Dissipation

The maximum motor drive current can be obtained from estimating total power dissipation of motor driver. There are a number of factors which limit actual current level such as motor rating, driver IC, PCB construction, ambient temperature and given application. All of power dissipation components must be considered to get reliable operation at the specific application. There is obvious power dissipations listed below in single H-bridge motor application.

- Conduction loss – Generally biggest power loss which is dissipated due to the  $R_{DS(ON)}$  and its temperature coefficient must be considered in the calculation

$$P_{COND} = (r_{DS(ON)-HS\_temp} + r_{DS(ON)-LS\_temp}) \cdot I_{OUT}^2$$
