

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

FDSS2407 N-Channel Dual MOSFET

62V, 3.3A, 132mΩ

Features

- 62V, 132mΩ, 5V Logic Level Gate Dual MOSFET in SO-8
- 5V Logic Level feedback signal of the drain to source voltage. Multiple devices can be wired "OR'd" to a single monitoring circuit input.
- Gate Drive Disable Input. Multiple devices controllable by a single disable transistor.
- Qualified to AEC Q101

Applications

- Automotive Injector Driver
- Solenoid Driver

General Description

This dual N-Channel MOSFET provides added functions as compared to a conventional Power MOSFET. These are: 1. A drain to source voltage feedback signal and 2. A gate drive disable control function that previously required external discrete circuitry. Including these functions within the MOSFET saves printed circuit board space. The drain to source voltage feedback function provides a 5V level output whenever the drain to source voltage is above 62V. This can monitor the time an inductive load takes to dissipate its stored energy. Multiple feedback signals can be wired "OR'd" together to a single input of the monitoring circuit. The gate disable function allows the device to be turned off independent of the drive signal on the gate. This function permits a second control circuit the ability to deactivate the load if necessary. It can also be wired "OR'd" allowing multiple devices to be controlled by a single open collector / drain control transistor.

FDSS2407 N-Channel Dual MOSFET

Pin 5 - Drain Feedback Output
Pin 7 - Gate Drive Disable Input

Internal Diagram

MOSFET Maximum Ratings $T_A=25^\circ\text{C}$ unless otherwise noted

Symbol	Parameter	Rated	Units
V_{DSS}	Drain to Source Voltage	62	V

Drain Feedback Characteristics

$V_{FBK(Low)}$	Feedback to Source Voltage	$V_{DS} = 35V, R_{FBK-SOURCE} = 51K\Omega$	-	1	1.5	V
$V_{FBK(High)}$	Feedback to Source Voltage	$V_{DS} = 62V, R_{FBK-SOURCE} = 51K\Omega$	3.5	4.4	-	V

Gate Drive Disable Characteristics

$V_{DIS(High)}$	Gate Drive Disable Input Voltage, Gate Enabled	$V_{GS} = 5V, I_D = 3.0A, T_J = 25^\circ C$	3	-	-	V
$V_{DIS(Low)}$	Gate Drive Disable Input Voltage, Gate Disabled	$V_{GS} = V_{DS} = 10V, I_D \leq 250\mu A, T_J = 150^\circ C$	-	-	0.4	V

Notes:

1. Starting $T_J = 25^\circ C, L = 42mH, I_{AS} = 2.6A, V_{DD} = 62V, V_{GS} = 10V$.
2. $55^\circ C/W$ measured using FR-4 board with $0.50 in^2 (323 mm^2)$ copper pad at 1 second.
3. $180^\circ C/W$ measured using FR-4 board with $0.027 in^2 (17.4 mm^2)$ copper pad at 1000 seconds.
4. $200^\circ C/W$ measured using FR-4 board with $0.006 in^2 (3.87 mm^2)$ copper pad at 1000 seconds.

This product has been designed to meet the extreme test conditions and environment demanded by the automotive industry. For a copy of the requirements, see AEC Q101 at: <http://www.aecouncil.com/>
 All ON Semiconductor products are manufactured, assembled and tested under ISO9000 and QS9000 quality systems certification.

Thermal Resistance vs. Mounting Pad Area

The maximum rated junction temperature, T_{JM} , and the thermal resistance of the heat dissipating path determines the maximum allowable device power dissipation, P_{DM} , in an application. Therefore the application's ambient temperature, T_A ($^{\circ}C$), and thermal resistance $R_{\theta JA}$ ($^{\circ}C/W$) must be reviewed to ensure that T_{JM} is never exceeded. Equation 1 mathematically represents the relationship and serves as the basis for establishing the rating of the part.

$$P_{DM} = \frac{(T_{JM} - T_A)}{R_{\theta JA}} \quad (\text{EQ. 1})$$

In using surface mount devices such as the SO8 package, the environment in which it is applied will have a significant influence on the part's current and maximum power dissipation ratings. Precise determination of P_{DM} is complex and influenced by many factors:

1. Mounting pad area onto which the device is attached and whether there is copper on one side or both sides of the board.
2. The number of copper layers and the thickness of the board.
3. The use of external heat sinks.
4. The use of thermal vias.
5. Air flow and board orientation.
6. For non steady state applications, the pulse width, the duty cycle and the transient thermal response of the part, the board and the environment they are in.

ON Semiconductor provides thermal information to assist the designer's preliminary application evaluation. Figure 25 defines the $R_{\theta JA}$ for the device as a function of the top copper (component side) area. This is for a horizontally positioned FR-4 board with 1oz copper after 1000 seconds of steady state power with no air flow. This graph provides the necessary information for calculation of the steady state junction temperature or power dissipation. Pulse applications can be evaluated using the ON Semiconductor device Spice thermal model or manually utilizing the normalized

maximum transient thermal impedance curve.

Thermal resistances corresponding to other copper areas can be obtained from Figure 25 or by calculation using Equation 2. The area, in square inches is the top copper area including the gate and source pads.

$$R_{\theta JA} = 79.9 + \frac{15}{0.14 + \text{Area}} \quad (\text{EQ. 2})$$

The transient thermal impedance ($Z_{\theta JA}$) is also effected by varied top copper board area. Figure 26 shows the effect of copper pad area on single pulse transient thermal impedance. Each trace represents a copper pad area in square inches corresponding to the descending list in the graph. Spice and SABER thermal models are provided for each of the listed pad areas.

Copper pad area has no perceivable effect on transient thermal impedance for pulse widths less than 100ms. For pulse widths less than 100ms the transient thermal impedance is determined by the die and package. Therefore, C THERM1 through C THERM5 and R THERM1 through R THERM5 remain constant for each of the thermal models. A listing of the model component values is available in Table 1.

A listing of ON Semiconductor's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. ON Semiconductor reserves the right to make changes without further notice to any products herein. ON Semiconductor makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does ON Semiconductor assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using ON Semiconductor products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by ON Semiconductor. "Typical" parameters which may be provided in ON Semiconductor data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
