

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Description

The FSA88x is a high-performance switch featuring automatic switching and accessory detection for a USB port. The FSA88x allows sharing of a common USB port to pass USB data, as well as factory programmability. In addition, the FSA88x integrates accessory detection of devices such as USB chargers and factory data cables. The FSA88x can be programmed for manual switching or automatic switching of data paths. VBUS\_IN has 28 V over-voltage tolerance.

The difference between the FSA880 and the FSA881 is that FSA880 JIG output is an open-drain, active-LOW output, while FSA881 JIG is an active-HIGH, CMOS output.

## Applications

- Cellular Phones, Smart Phones
- MP3 and PMP

## Related Resources

- FSA880 / FSA881 Demonstration Board

## Typical Application

Figure 1. Mobile Phone Example

### Ordering Information

| Part Number | Operating Temperature Range | Top Mark | Package  |
|-------------|-----------------------------|----------|--|
| FSA880UMX   | -40 to +85°C                | KU       | 16-Lead, Ultrathin Molded Leadless Package (UMLP), 1.8 mm x 2.6 mm x 0.55 mm, 0.4 mm Pitch |
| FSA881UMX   | -40 to +85°C                | KX       | 16-Lead, Ultrathin Molded Leadless Package (UMLP), 1.8 mm x 2.6 mm x 0.55 mm, 0.4 mm Pitch |

| <b>I<sup>2</sup>C Interface</b> |       |  |                             |  |
| I2C_SCL                         | 10    | Input  | Hi-Z                        | I <sup>2</sup> C serial clock signal to be connected to the phone-based I <sup>2</sup> C master  |
| I2C_SDA                         | 11    | Open-Drain I/O                                   | Hi-Z                        | I <sup>2</sup> C serial data signal to be connected to the phone-based I <sup>2</sup> C master   |
| INTB                            | 9     | CMOS Output                                      | LOW                         | Interrupt active LOW output used to prompt the phone baseband processor to read the I <sup>2</sup> C register bits, indicate a change in ID_CON pin status or accessories' attach status |

### Note:

1. LOW = V<sub>OL</sub> or V<sub>IL</sub>; HIGH = V<sub>OH</sub> or V<sub>IH</sub>.

## 1. Functionality

The FSA88x is USB port accessory detector and switch with integrated 28 V over-voltage tolerance. Fully controlled using I<sup>2</sup>C, FSA88x enables high-speed USB 2.0 Standard Downstream Port (SDP), USB Charging Downstream Port (CDP) battery charger, USB Dedicated Charging Port (DCP) charger data cables to use a common connector micro or mini USB 2.0 port. Factory-mode cables can be detected and switched to use either the UART or USB data path. The FSA88x can be programmed for manual switching or automatic switching of data paths.

The architecture uses ID pin detection for convenient factory testing. Figure 9 - Figure 13 show the FSA88x passing the USB eye compliance test with ample margin.

### 1.1. Functional Overview

The FSA88x is designed for minimal software requirements for proper operation. The flow diagram in Figure 4 walks through the fundamental steps of operation and contains references to more detailed information.

| Flow Diagram  | State                          | Datasheet Section | Description   |
|---|--------------------------------|-------------------|---|
| <pre> graph TD     A[Power-up &amp; Reset] --&gt; B[I2C]     B --&gt; C[Configuration]     C --&gt; D[Accessory Plug-in]     D --&gt; E[Detection]     E --&gt; F[Processor Communication]     F --&gt; G[Switch Configuration]     G --&gt; H[Active Signals]     H --&gt; I[Accessory Detached]     I --&gt; D                     </pre> | <b>Power-Up &amp; Reset</b>    | <i>Section 2</i>  | Applies power to the device and resets state of the device  |
|   | I <sup>2</sup> C               | <i>Section 3</i>  | Communication with device through I <sup>2</sup> C  |
|   | <b>Configuration</b>           | <i>Section 4</i>  | Configures the device using I <sup>2</sup> C and the internal registers (which can be bypassed during power-up) |
|   | <b>Detection</b>               | <i>Section 5</i>  | Manages accessory detection, including attachment and detachment  |

Figure 4. Basic Operation Flow

## 2. Power-Up & Reset

The FSA88x does not need special power sequencing for correct operation. The main power is provided by  $V_{BAT}$  only.  $V_{DDIO}$  is only used for I<sup>2</sup>C interface and interrupt processing.

Table 1 summarizes the enabled features of each power state. The valid voltages levels for each power supply can be found in Section 9.

**Table 1. Power States Summary**

| Valid $V_{BUS\_IN}$ | Valid $V_{BAT}$ | Valid $V_{DDIO}^{(1)}$ | Power State            | Enabled Functionality                                   |           |
|---------------------|-----------------|------------------------|------------------------|---|-----------|
|                     |                 |                        |                        | Processor Communication (I <sup>2</sup> C & Interrupts) | Detection |
| X                   | N               | N                      | Power Down             | NO  |           |
| X                   | N               | Y <sup>(2)</sup>       | Not Typical            | Illegal State   |           |
| X                   | Y               | N                      | Powered from $V_{BAT}$ | NO  | YES       |
| X                   | Y               | Y                      | Powered from $V_{BAT}$ | YES   | YES       |

**Notes:**

1.  $V_{DDIO}$  is expected to be the same supply used by the baseband I/Os.
2. Typically  $V_{DDIO}$  is only present when  $V_{BAT}$  is valid.
3. X = Don't care.

### 2.1. Reset

When the device is reset, all the registers are initialized to the default values shown in Section 9.9 and all switch paths are open. After reset or power up, FSA88x enters Standby Mode and is ready to detect accessories sensed on its  $V_{BUS\_IN}$  and / or ID\_CON pins.

#### 2.1.1. Hardware Reset

Power-on reset is caused by the initial rising edge of  $V_{BAT}$

#### 2.1.2. Software Reset

The device can be reset through software by writing to the Reset bit in the Register (1BH).

### 3. I<sup>2</sup>C

The FSA88x integrates a full fast-mode I<sup>2</sup>C slave controller compliant with the I<sup>2</sup>C specification version 2.1. The FSA88x I<sup>2</sup>C interface runs up to 400 kHz.

The slave address is shown in Table 2. Status information and configuration occurs via the I<sup>2</sup>C interface. *Please see Table 7 for more information.*

**Table 2. I<sup>2</sup>C Slave Address**

| Name          | Size (Bits) | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0        |
|---------------|-------------|-------|-------|-------|-------|-------|-------|-------|--------------|
| Slave Address | 8           | 0     | 1     | 0     | 0     | 1     | 0     | 1     | Read / Write |

**Figure 5. I<sup>2</sup>C Write Sequence**

**Figure 6. I<sup>2</sup>C Read Sequence**

|   |                      |          |                       |           |                            |           |                |
|---|----------------------|----------|-----------------------|-----------|----------------------------|-----------|----------------|
| □ | From Master to Slave | <b>S</b> | Start Condition       | <b>NA</b> | NOT Acknowledge (SDA High) | <b>RD</b> | Read =1        |
| □ | From Slave to Master | <b>A</b> | Acknowledge (SDA Low) | <b>WR</b> | Write=0                    | <b>P</b>  | Stop Condition |

### 4. Configuration

FSA88x requires minimal configuration for proper detection and reporting. The following steps provide full configuration.

1. Write Control register (02h) to configure manual or automatic switching modes.
- a. If using manual switching modes, write Manual SW 1 register (13h) to configure switches.
2. Write Control register (02h) to clear INT Mask bit. This enables interrupts to the baseband.

## 5. Detection

The FSA88x monitors both  $V_{BUS\_IN}$  and ID\_CON to detect accessories. The ID\_CON detection is a “resistive detection” that reads the resistance to GND on the ID\_CON pin to determine the accessory attached. Table 3 shows the assignment of accessories based on resistor values.

FSA88x can also detect accessories with ID resistances outside the specified ranges. The FSA88x detects these unknown accessories in the same manner as the defined accessories and interrupts the baseband processor and provides the correct ADC value, as shown in Table 3.

**Table 3. ID\_CON Accessory Detection**

| ADC Code                   |   |   |   |   | Equivalent $R_{ID}$ |                               |                  | Description                                   |
|----------------------------|---|---|---|---|---------------------|-------------------------------|------------------|---|
| 4                          | 3 | 2 | 1 | 0 | Min.                | Target                        | Max.             |   |

| 1                          | 1 | 0 | 1 | 1 | 428.7 k $\Omega$    | 442 k $\Omega$ <sup>(4)</sup> | 455.3 k $\Omega$ | Unknown Accessory                             |
| 1                          | 1 | 1 | 0 | 0 | 507.3 k $\Omega$    | 523 k $\Omega$                | 538.7 k $\Omega$ | Factory Mode Boot OFF-UART                    |
| 1                          | 1 | 1 | 0 | 1 | 600.4 k $\Omega$    | 619 k $\Omega$                | 637.6 k $\Omega$ | Factory Mode Boot ON-UART                     |
| 1                          | 1 | 1 | 1 | 0 | 750 k $\Omega$      | 1000 k $\Omega$               | 1030 k $\Omega$  | Unknown Accessory                             |
| Not 'h1F or any code above |   |   |   |   | 3 M $\Omega$        | None of the above ranges      |                  | Unknown Accessory                             |

**Note:**

- These accessories need VBUS to be valid in order to be detected since they are charger accessories.

### 5.1. Factory Cable Detection

Factory modes are initiated with the attachment of special test hardware, called a “JIG box” for factory testing. The FSA88x automatically configures switch paths to any of the factory-mode accessories when the appropriate resistor is sensed on the ID\_CON pin. A change of resistor on the ID\_CON pin dynamically switches between factory modes and auto-configures the appropriate switch paths without detaching and attaching the cable.

The different factory mode accessories with the associated resistor values (1% standard resistors) on the ID\_CON pin

and the JIG and BOOT logic states are listed in Table 4. The FSA88x allows both HS USB and FS USB in addition to UART signals to be passed on both ports with matched performance. This allows greater flexibility when designing with the FSA88x.

JIG output signals when a factory mode accessory is plugged in and BOOT output signals the mobile phone to boot up. The switch paths for factory modes are shown in Table 4.

**Table 4. ID\_CON Factory Cable Detection**

| Configuration Type            |          | DP_CON   | DM_CON   | ID_CON        |               |               | BOOT | FSA880 JIG | FSA881 JIG |
|-------------------------------|----------|----------|----------|---------------|---------------|---------------|------|------------|------------|
| <b>Factory Mode Jig: UART</b> | Boot_On  | DP_HOST1 | DM_HOST1 | 600k $\Omega$ | 619k $\Omega$ | 637k $\Omega$ | HIGH | LOW        | HIGH       |
|                               | Boot_Off | DP_HOST1 | DM_HOST1 | 507k $\Omega$ | 523k $\Omega$ | 538k $\Omega$ | LOW  | LOW        | HIGH       |
| <b>Factory Mode Jig: USB</b>  | Boot_On  | DP_Host  | DM_Host  | 292k $\Omega$ | 301k $\Omega$ | 310k $\Omega$ | HIGH | LOW        | HIGH       |
|                               | Boot_Off | DP_Host  | DM_Host  | 247k $\Omega$ | 255k $\Omega$ | 262k $\Omega$ | LOW  | LOW        | HIGH       |

The FSA88x detection algorithms monitor both the  $V_{BUS}$  and ID pins of the USB interface. Based on the detection results, multiple registers are updated and the INTB pin is asserted to indicate to the baseband processor that an accessory was detected and to read the registers for the complete

information. The detection algorithm allows the application to control the timing of the detection algorithm and the configuration of the internal switches. The flow diagram in Figure 7 shows the operation of the detection algorithm.

Figure 7. Factory Cable Detection Flow Chart (FSA880)

## 5.2. USB Port Detection

The multiple types of USB 2.0 ports the FSA88x can detect are summarized in Table 5.

**Table 5. ID\_CON and VBUS Detection Table for USB Devices**

| V <sub>BUS_IN</sub> | DP_CON            | DM_CON            | ID_CON resistance to GND |        |        | Accessory Detected <sup>(5)</sup>  |
|---------------------|-------------------|-------------------|--------------------------|--------|--------|--|
|                     |                   |                   | Min.                     | Typ.   | Max.   |  |
| 5V                  | Not Checked       | Not Checked       | 174.6 kΩ                 | 200 kΩ | 206 kΩ | TA (travel adapter) Charger (180 kΩ) and Car Kit Charger Type 1 only (200 kΩ) <sup>(6)</sup> |
| 5V                  | Shorted to DM_CON | Shorted to DP_CON | 3 MΩ                     | Open   | Open   | USB Dedicated Charging Port, Travel Adapter or Dedicated Charger (DCP) <sup>(6)</sup>        |
| 5V                  | DP_HOST           | DM_HOST           | 3 MΩ                     | Open   | Open   | USB Charging Downstream Port (CDP) <sup>(6)</sup>  |
| 5V                  | DP_HOST           | DM_HOST           | 3 MΩ                     | Open   | Open   | USB Standard Downstream Port (SDP) <sup>(6)</sup>  |

**Notes:**

5. The accessory type is reported in the Device Type 1 (0Ah) register for each valid accessory detected.
6. The FSA88x follows the Battery Charging 1.1 specification, which uses DP\_CON and DM\_CON to determine the USB accessory attached. Refer to *Battery Charging 1.1 specification* for further details.

For SDP and CDP USB accessories, the following pin mapping is automatically configured:

- DP\_HOST = DP\_CON
- DM\_HOST = DM\_CON

For DCP charger, the DP\_HOST and DM\_HOST switches are open. For all USB accessories V<sub>BUS\_IN</sub> is Over-Voltage Tolerance (OVT) up to 28 V.

## 6. Processor Communication

Typical communication steps between the processor and the FSA88x during accessory detection are:

1. INTB is asserted LOW, indicating change in accessory detection.
2. Processor reads Interrupt 1 (03h) register to determine if an attach or detach event was detected.
3. Processor reads Status registers to determine the exact accessory detected.
  - a. Device Type 1 (0Ah): Indicates which USB, Car Kit CDP, or DCP accessory was detected.
  - b. Device Type 2 (0Bh): Indicates which factory mode or unknown accessory was detected.

## 7. Switch Configuration

FSA88x devices have two modes of operation when configuring the internal switches. The FSA88x can auto-configure the switches or the switches can be configured

manually by the processor. Typical applications use Auto-Configuration Mode and do not require interaction with the baseband to configure the switches correctly.

### 7.1. Configurations

**USB Accessories and Factory Cables:**  
**DP\_CON=DP\_HOST**  
**DM\_CON=DM\_HOST**

**UART Factory Cables:**  
**DP\_CON=DP\_HOST1**  
**DM\_CON=DM\_HOST1**

Figure 8. Switch Configurations

### 7.2. Manual Switching

Manual switching is enabled by writing the following registers:

- Manual Switch 1 (13h): Configures the switches for DM\_CON, and DP\_CON.
- Manual Switch 2 (14h): Configures the BOOT, and JIG pins.

## 9. Product Specifications

### 9.1. Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

| Symbol              | Parameter   |  | Min.     | Max. | Unit |
|---------------------|---|--|----------|------|------|
| V <sub>BAT</sub>    | Supply Voltage from Battery                                   |  | -0.5     | 6.0  | V    |
| V <sub>BUS_IN</sub> | Supply Voltage from USB Connector                             |  | -0.5     | 28.0 | V    |
| V <sub>SW</sub>     | Switch I/O Voltage  | USB  | -1.0     | 6.0  | V    |
|                     |   | UART   | -1.0     | 6.0  |      |
| I <sub>IK</sub>     | Input Clamp Diode Current                                     |  | -50      |      | mA   |
| I <sub>SW</sub>     | Switch I/O Current (Continuous)                               | USB at T <sub>A</sub> =85°C  |          | 25   | mA   |
|                     |   | UART at T <sub>A</sub> =85°C   |          | 12   |      |
| I <sub>SWPEAK</sub> | Peak Switch Current (Pulsed at 1ms Duration, <10% Duty Cycle) |  |          | 150  | mA   |
| T <sub>STG</sub>    | Storage Temperature Range                                     |  | -65      | +150 | °C   |
| T <sub>J</sub>      | Maximum Junction Temperature                                  |  |          | +150 | °C   |
| T <sub>L</sub>      | Lead Temperature (Soldering, 10 Seconds)                      |  |          | +260 | °C   |
| ESD                 | IEC 61000-4-2 System ESD                                      | USB Connector Pins (DP_CON, DM_CON, V <sub>BUS_IN</sub> , ID_CON) to GND | Air Gap  | 15   | kV   |
|                     |   |  | Contact  | 8    |      |
|                     | Human Body Model, JEDEC JESD22-A114                           |  | All Pins | 4    |      |
|                     | Charged Device Model, JEDEC JESD22-C101                       |  | All Pins | 2    |      |

### 9.2. Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

| Symbol             | Parameter  |                  | Min. | Typ. | Max. | Unit |
|--------------------|--|------------------|------|------|------|------|
| V <sub>BAT</sub>   | Battery Supply Voltage   |                  | 3.0  |      | 4.4  | V    |
| V <sub>BUSIN</sub> | V <sub>BUS_IN</sub> Voltage                                    |                  | 4.0  |      | 5.5  | V    |
| V <sub>DDIO</sub>  | Processor Supply Voltage                                       |                  | 1.8  |      | 3.6  | V    |
| V <sub>SW</sub>    | Switch I/O Voltage   | USB Path Active  | 0    |      | 3.6  | V    |
|                    |  | UART Path Active | 0    |      | 3.6  |      |
| ID <sub>CAP</sub>  | Capacitive Load on ID_CON Pin for Reliable Accessory Detection |                  |      |      | 1.0  | nF   |
| T <sub>A</sub>     | Operating Temperature  |                  | -40  |      | +85  | °C   |

### 9.3. Switch Path DC Electrical Characteristics

All typical values are at  $T_A=25^\circ\text{C}$  unless otherwise specified.

| Symbol  | Parameter  | $V_{BAT}$ (V) | Conditions  | $T_A = -40$ to $+85^\circ\text{C}$ |       |                      | Unit          |
|---|--|---------------|---|------------------------------------|-------|----------------------|---------------|
|   |  |               |   | Min.                               | Typ.  | Max.                 |               |
| <b>Host Interface Pins (BOOT, JIG, INTB)</b>                        |  |               |   |                                    |       |                      |               |
| $V_{OH}$  | Output High Voltage (FSA881 JIG Output)                                    | 3.0 to 4.4    | $I_{OH}=-2$ mA  | $0.8 \cdot V_{BAT}$                |       |                      | V             |
| $V_{OH}$  | Output High Voltage (just BOOT & INTB Outputs) <sup>(7)</sup>              | 3.0 to 4.4    | $I_{OH}=-2$ mA  | $0.7 \cdot V_{DDIO}$               |       |                      | V             |
| $V_{OL}$  | Output Low Voltage (INTB, JIG & BOOT Outputs)                              | 3.0 to 4.4    | $I_{OL}=3$ mA   |                                    |       | 0.4                  | V             |
| <b>I<sup>2</sup>C Interface Pins – Fast Mode (I2C_SDA, I2C_SCL)</b> |  |               |   |                                    |       |                      |               |
| $V_{IL}$  | Low-Level Input Voltage  | 3.0 to 4.4    |   |                                    |       | $0.3 \cdot V_{DDIO}$ | V             |
| $V_{IH}$  | High-Level Input Voltage   | 3.0 to 4.4    |   | $0.7 \cdot V_{DDIO}$               |       |                      | V             |
| $V_{HYS}$   | Hysteresis of Schmitt Trigger Inputs                                       | 3.0 to 4.4    | $V_{DDIO}>2$ V  | $0.05 V_{DDIO}$                    |       |                      | V             |
|   |  |               | $V_{DDIO}<2$ V  | $0.1 V_{DDIO}$                     |       |                      | V             |
| $V_{OL1}$   | Low-Level Output Voltage at 3 mA Sink Current (Open-Drain)                 | 3.0 to 4.4    | $V_{DDIO}>2$ V  |                                    |       | 0.4                  |               |
|   |  |               | $V_{DDIO}<2$ V  |                                    |       | $0.2 \cdot V_{DDIO}$ | V             |
| $I_{I2C}$   | Input Current of I2C_SDA and I2C_SCL Pins                                  | 3.0 to 4.4    | Input Voltage 0.26 V to 2.34 V                        | -10                                |       | 10                   | $\mu\text{A}$ |

| $I_{CCSL}$  | Battery Supply Standby Mode Current (No Accessory Attached)                | 3.0 to 4.4    | No Accessory, Static Current During Standby Mode      |                                    | 15    | 25                   | $\mu\text{A}$ |
| $I_{CCSLWA}$  | Battery Supply Standby Mode Current with Accessory Attached <sup>(7)</sup> | 3.0 to 4.4    | With non-Factory Mode Accessories Attached            |                                    | 30    | 40                   | $\mu\text{A}$ |
|   |  |               | With Factory Mode Accessories Attached <sup>(9)</sup> |                                    | 100   | 120                  | $\mu\text{A}$ |

#### Notes:

- Limits based on electrical characterization data.
- On resistance is the voltage drop between the two terminals at the indicated current through the switch.
- Factory mode accessories leave the detection circuitry active after attach to allow detection of ID changes without an attach.

## 9.4. Capacitance

| Symbol          | Parameter                     | V <sub>BAT</sub> (V) | Conditions                        | T <sub>A</sub> = -40 to +85°C |      |      | Unit |

## 9.6. I<sup>2</sup>C AC Electrical Characteristics

| Symbol              | Parameter   | Fast Mode            |      | Unit |
|---------------------|---|----------------------|------|------|
|                     |   | Min.                 | Max. |      |
| f <sub>SCL</sub>    | I2C_SCL Clock Frequency   | 0                    | 400  | kHz  |
| t <sub>HD,STA</sub> | Hold Time (Repeated) START Condition                              | 0.6                  |      | μs   |
| t <sub>LOW</sub>    | LOW Period of I2C_SCL Clock                                       | 1.3                  |      | μs   |
| t <sub>HIGH</sub>   | HIGH Period of I2C_SCL Clock                                      | 0.6                  |      | μs   |
| t <sub>SU,STA</sub> | Set-up Time for Repeated START Condition                          | 0.6                  |      | μs   |
| t <sub>HD,DAT</sub> | Data Hold Time  | 0                    | 0.9  | μs   |
| t <sub>SU,DAT</sub> | Data Set-up Time <sup>(10)</sup>                                  | 100                  |      | ns   |
| t <sub>r</sub>      | Rise Time of I2C_SDA and I2C_SCL Signals <sup>(10,11)</sup>       | 20+0.1C <sub>b</sub> | 300  | ns   |
| t <sub>f</sub>      | Fall Time of I2C_SDA and I2C_SCL Signals <sup>(10,11)</sup>       | 20+0.1C <sub>b</sub> | 300  | ns   |
| t <sub>SU,STO</sub> | Set-up Time for STOP Condition                                    | 0.6                  |      | μs   |
| t <sub>BUF</sub>    | BUS-Free Time between STOP and START Conditions                   | 1.3                  |      | μs   |
| t <sub>SP</sub>     | Pulse Width of Spikes that Must Be Suppressed by the Input Filter | 0                    | 50   | ns   |

### Notes:

- A fast-mode I<sup>2</sup>C Bus<sup>®</sup> device can be used in a Standard-Mode I<sup>2</sup>C Bus system, but the requirement t<sub>SU,DAT</sub> ≥ 250 ns must be met. This is automatically the case if the device does not stretch the LOW period of the I2C\_SCL signal. If a device does stretch the LOW period of the I2C\_SCL signal, it must output the next data bit to the I2C\_SDA line t<sub>r,max</sub> + t<sub>SU,DAT</sub> = 1000 + 250 = 1250 ns (according to the Standard-Mode I<sup>2</sup>C bus specification) before the I2C\_SCL line is released.
- C<sub>b</sub> equals the total capacitance of one bus line in pF. If mixed with high-speed devices, faster fall times are allowed by the I<sup>2</sup>C specification.

Figure 15. Definition of Timing for Full-Speed Mode Devices on the I<sup>2</sup>C Bus®

Table 6. I<sup>2</sup>C Slave Address

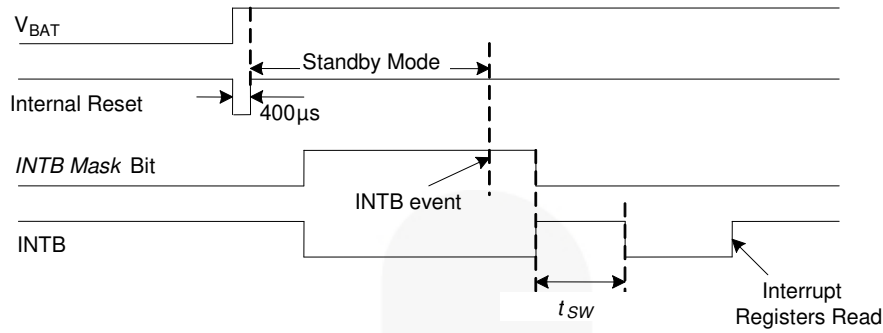

| Name          | Size (Bits) | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|---------------|-------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Slave Address | 8           | 0     | 1     | 0     | 0     | 1     | 0     | 1     | R/W   |

### 9.7. Switch Path AC Electrical Characteristics

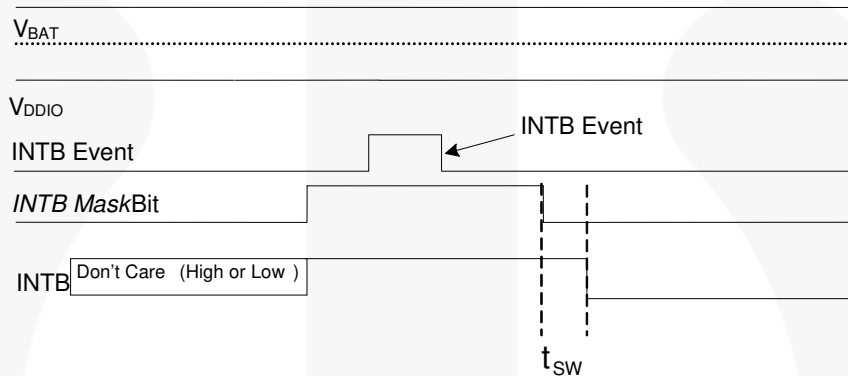

All typical values are for  $V_{BAT}=3.8$  V at  $T_A=25^\circ\text{C}$  unless otherwise specified.

| Symbol               | Parameter  | Conditions   | Min. | Typ. | Max. | Unit |
|----------------------|--|--|------|------|------|------|
| Xtalk                | Active Channel Crosstalk<br>DP_CON to DM_CON   | USB Mode<br>$f=1$ MHz, $R_T=50$ $\Omega$ , $C_L=0$ pF                  |      | -60  |      | dB   |
|                      |  | $f=240$ MHz, $R_T=50$ $\Omega$ ,<br>$C_L=0$ pF                         |      | -30  |      |      |
| O <sub>IRR</sub>     | Off Isolation  | USB Mode<br>$f=1$ MHz, $R_T=50$ $\Omega$ , $C_L=0$ pF                  |      | -60  |      | dB   |
| t <sub>SK(P)</sub>   | Skew of Opposite Transitions of the Same Output (USB Mode)   | $t_r=t_f=750$ ps (10-90%) at<br>240 MHz, $C_L=0$ pF, $R_L=50$ $\Omega$ |      | 35   |      | ps   |
| t <sub>sw</sub>      | Time after <i>INT Mask</i> Cleared to “0” until INTB Goes LOW to Signal the Interrupt after Interruptible Event while <i>INT Mask</i> Bit Set to “1” | See Figure 16 and Figure 17  |      | 10   |      | ms   |
| t <sub>SDPDET</sub>  | Time from $V_{BUS\_IN}$ Valid to USB Switches Closed for USB Standard Downstream Port  | See Figure 17  |      | 130  |      | ms   |
| t <sub>CHGOUT</sub>  | Time from $V_{BUS\_IN}$ Valid to USB Switches Closed for USB Charging Downstream Port (CDP)  | See Figure 18  |      | 170  |      | ms   |
| t <sub>JIGVBUS</sub> | Time from $V_{BUS\_IN}$ Valid to JIG LOW for Factory Mode Operation with $V_{BUS\_IN}$ Present   | See Figure 20  |      | 200  |      | ms   |
| t <sub>JIGVBUS</sub> | Time from $V_{BUS\_IN}$ Valid to JIG LOW for Factory Mode Operation without $V_{BUS\_IN}$ Present  | See Figure 21  |      | 200  |      | ms   |

| 1:0   | DoNotUse         | 2           | N/A  |

**Note:**

15. When switching between manual switch configurations on a single attach, the accessory must pass through an “000: Open Switch” state between configurations. Manual Modes must have an accessory attached prior to operation. The FSA88x does not configure per the Manual Modes register if an accessory has not been previously attached.

## 10. Layout Guidelines

### 10.1. PCB Layout Guidelines for High-Speed USB Signal Integrity

1. Place FSA88x as close to the USB controller as possible. Shorter traces mean less loss, less chance of picking up stray noise, and less radiated EMI.
  - a) Keep the distance between the USB controller and the device less than 25 mm (< one inch).
  - b) For best results, this distance should be <18mm. This keeps it less than one quarter ( $\frac{1}{4}$ ) of the transmission electrical length.
2. Use an impedance calculator to ensure 90  $\Omega$  differential impedance for DP\_CON and DM\_CON lines.
3. Select the best transmission line for the application.
  - a) For example, for a densely populated board, select an edge-coupled differential stripline.
4. Minimize the use of vias and keep HS USB lines on same plane in the stack.
  - a) Vias are an interruption in the impedance of the transmission line and should be avoided.
  - b) Try to avoid routing schemes that generally force the use of at least two vias: one on each end to get the signal to and from the surface.
5. Cross lines, only if necessary, orthogonally to avoid noise coupling (traces running in parallel couple).
6. If possible, separate HS USB lines with GND to improve isolation.
  - a) Routing GND, power, or components close to the transmission lines can create impedance discontinuities.
7. Match transmission line pairs as much as possible to improve skew performance.
8. Avoid sharp bends in PCB traces; a chamfer or rounding is generally preferred.
9. Place decoupling for power pins as close to the device as possible.
  - a) Use low-ESR capacitors for decoupling if possible.
  - b) A tuned PI filter should be used to negate the effects of switching power supplies and other noise sources if needed.

### 10.2. Layout for GSM / TDMA Buzz Reduction

There are two possible mechanisms for TDMA / GSM noise to negatively impact FSA88x performance. The first is the result of large current draw by the phone transmitter during active signaling when the transmitter is at full or almost-full power. With the phone transmitter dumping large amounts of current in the phone GND plane; it is possible for there to be temporary voltage excursions in the GND plane if not properly designed. This noise can be coupled back through the GND plane into the FSA88x device and, although the FSA88x has very good isolation; if the GND noise amplitude is large enough, it can result in noise coupling to the FSA88x. The second path for GSM noise is through electromagnetic coupling onto the signal lines themselves.

In most cases, the noise introduced as a result is on the  $V_{BAT}$  and / or GND supply rails. Following are recommendations for PCB board design that help address these two sources of TDMA / GSM noise.

1. Provide a wide, low-impedance GND return path to both the FSA88x and to the power amplifier that sources the phone transmit block.
2. Provide separate GND connections to PCB GND plane for each device. Do not share GND return paths among devices.
3. Add as large a decoupling capacitor as possible ( $\geq 1\mu\text{F}$ ) between the  $V_{BAT}$  pin and GND to shunt any power supply noise away from the FSA88x. Also add decoupling capacitance at the PA (*see the reference application schematic in Figure 22 for recommended decoupling capacitor values*).
4. Add 33 pF shunt capacitors on any PCB nodes with the potential to collect radiated energy from the phone transmitter.
5. Add a series  $R_{BAT}$  resistor prior to the decoupling capacitor on the  $V_{BAT}$  pin to attenuate noise prior to reaching the FSA88x.

### 11. Reference Schematic

Figure 22. Reference Schematic

Table 17. Reference Schematic Component Values

| Symbol              | Parameter                               | Recommended Value |      |      | Unit | Notes   |
|---------------------|---|-------------------|------|------|------|---|
|                     |   | Min.              | Typ. | Max. |      |   |
| C <sub>VBUS</sub>   | V <sub>BUS_IN</sub> Decoupling          | 1.0               | 4.7  | 10.0 | μF   | This is the recommended capacitance in the USB standard (for the downstream port V <sub>BUS</sub> capacitance specification).                                   |
| C <sub>VBAT</sub>   | V <sub>BAT</sub> Decoupling Capacitance |                   | 1    | 10   | μF   | Increasing this capacitance can help reduce GSM / TDMA noise.   |
| R <sub>BAT</sub>    | V <sub>BAT</sub> Series Resistance      |                   | 50   | 100  | Ω    | Adding series resistance can help reduce GSM / TDMA noise. Ensure that resistance is small enough to not reduce V <sub>BAT</sub> levels under normal operation. |
| R <sub>PU_I2C</sub> | I <sup>2</sup> C Pull-up Resistance     |                   | 4.7  |      | kΩ   | The actual value used must allow compliance to I <sup>2</sup> C specification based on V <sub>DDIO</sub> and bus capacitance.                                   |
| R <sub>PU_JIG</sub> | JIG Pull-up Resistance (FSA880 ONLY)    |                   | 100  |      | kΩ   | Pull-up resistance for open-drain JIG pin.  |
| R <sub>DP/DM</sub>  | DP_CON/DM_CON Series Resistance         |                   | 2.2  |      | Ω    | Series resistance to improve surge performance of high-speed USB path.  |
| TVS                 | High-Speed TVS Diodes                   |                   | 1    |      | pF   | Recommended high-speed TVS diodes to improve ESD performance.   |
| TVS_OPT             | Optional High-Speed TVS Diodes          |                   | 1    |      | pF   | Optional high-speed TVS diodes to improve ESD performance.  |
