### Notes:

- Circuit ground is internally isolated from chassis ground.
- T<sub>FAULT</sub> is an open collector/drain output, which should be pulled up with a 4.7k – 10k Ohms resistor on the host board if intended for use. Pull up voltage should be between 2.0V to V<sub>cc</sub> + 0.3V. A high output indicates a transmitter fault caused by either the TX bias current or the TX output power exceeding the preset alarm thresholds. A low output indicates normal operation. In the low state, the output is pulled to <0.8V.
- Laser output disabled on T<sub>DIS</sub> >2.0V or open, enabled on T<sub>DIS</sub> <0.8V.
- Internally pulled down per SFF-8431 Rev 2.0. See Sec. X for the logic table to use for the internal CDRs locking modes.
- LOS is open collector output. Should be pulled up with 4.7k – 10kΩ on host board to a voltage between 2.0V and 3.6V. Logic 0 indicates normal operation; logic 1 indicates loss of signal.

These products are certified by TÜV and CSA to meet the Class 1 eye safety requirements of EN (IEC) 60825 and the electrical safety requirements of EN (IEC) 60950. Copies of certificates are available at Finisar Corporation upon request.

## VIII. Digital Diagnostic Functions

Finisar FTLX1472M3BCL SFP+ transceivers support the 2-wire serial communication protocol as defined in the SFP MSA [1]. It is very closely related to the E<sup>2</sup>PROM defined in the GBIC standard, with the same electrical specifications.

The standard SFP serial ID provides access to identification information that describes the transceiver's capabilities, standard interfaces, manufacturer, and other information.

Additionally, Finisar SFP+ transceivers provide an enhanced digital diagnostic monitoring interface, which allows real-time access to device operating parameters such as transceiver temperature, laser bias current, transmitted optical power, received optical power and transceiver supply voltage. It also defines a sophisticated system of alarm and warning flags, which alerts end-users when particular operating parameters are outside of a factory set normal range.

The SFP MSA defines a 256-byte memory map in E<sup>2</sup>PROM that is accessible over a 2-wire serial interface at the 8 bit address 1010000X (A0h). The digital diagnostic monitoring interface makes use of the 8 bit address 1010001X (A2h), so the originally defined serial ID memory map remains unchanged. The interface is identical to, and is thus fully backward compatible with both the GBIC Specification and the SFP Multi Source Agreement. The complete interface is described in Finisar Application Note AN-2030: "Digital Diagnostics Monitoring Interface for SFP Optical Transceivers".

The operating and diagnostics information is monitored and reported by a Digital Diagnostics Transceiver Controller (DDTC) inside the transceiver, which is accessed through a 2-wire serial interface. When the serial protocol is activated, the serial clock signal (SCL, Mod Def 1) is generated by the host. The positive edge clocks data into the SFP transceiver into those segments of the E<sup>2</sup>PROM that are not write-protected. The negative edge clocks data from the SFP transceiver. The serial data signal (SDA, Mod Def 2) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially.

For more information, please see the SFP MSA documentation [1], [6] and Finisar Application Note AN-2030. Please note that evaluation board FDB-1027 is available with Finisar ModDEMO software that allows simple to use communication over the 2-wire serial interface.

## IX. Digital Diagnostic Specifications

FTLX1472M3BCL transceivers can be used in host systems that require either internally or externally calibrated digital diagnostics.

Parameter	Symbol	Units	Min	Max	Accuracy	Ref.
<b>Accuracy</b>						
Transceiver temperature	$\Delta DD_{Temp}$	°C	-10	80	$\pm 5^{\circ}C$	1
Transceiver supply voltage	$\Delta DD_{Voltage}$	V	2.8	4.0	$\pm 3\%$

Receiver average optical input power	$\Delta DD_{Rx-Power}$	dBm	-22	+2	$\pm 2dB$	

Notes: 1. Internally measured

2. Accuracy of measured Tx bias current is 10% of the actual bias current from the laser driver to the laser.

## X. Internal CDR's Locking Modes

The FTLX1472M3BCL is equipped with internal CDR units on both the receiver and the transmitter sides. The host can set the CDR's to lock at 8.5Gb/s, 10G (9.95-11.3Gb/s), or in by-pass mode, by setting the rate select pins or the soft bits (logic OR). The different locking modes are shown in the following logic table:

R/S 0 Logic OR of: pin 7 & bit 110.3	R/S 1 Logic OR of: pin 9 & bit 118.3	CDR's Locking Mode
Low or 0	Low or 0	Both CDR's lock at 8.5Gb/s
Low or 0	High or 1	Tx CDR is in bypass mode. Rx CDR locks at 10G (9.95-11.3Gb/s)
High or 1	Low or 0	Tx & Rx CDR's in bypass mode
High or 1	High or 1	Both CDR's lock at 10G (9.95-11.3Gb/s) The bits 110.3 and 118.3 are set to 1 by default at power-up

The RS0 and RS1 pins are internally pulled-down to ground as per [1]. The soft bits 110.3 and 118.3 are both set to "1" at the transceiver power-up, to select the 10G locking mode by default. The host can change this configuration via the 2-wire communication as described in the SFP MSA [1]. Alternative configurations can be factory set upon request. Please refer to Finisar for additional details.

## XI. SFF-8431 Power-up Sequence

The typical power consumption of the FTLX1472M3BCL will not exceed the limit of 1.5W specified in [1] for the Power Level II device. Moreover, the FTLX1472M3BCL is factory set to power-up directly to its operating conditions in Power Level Mode II, but upon request, it can be factory set to follow the power-up sequence specified in the SFF-8431 for transceivers exceeding 1W.

For additional details please, refer to [1] and Finisar's Application Note AN-2076.
