## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## 57MHz, Wideband, Four Quadrant, Voltage Output Analog Multiplier

The HA-2556 is a monolithic, high speed, four quadrant, analog multiplier constructed in the Intersil Dielectrically Isolated High Frequency Process. The voltage output simplifies many designs by eliminating the current-to-voltage conversion stage required for current output multipliers. The HA-2556 provides a $450 \mathrm{~V} / \mu$ s slew rate and maintains 52 MHz and 57 MHz bandwidths for the $X$ and $Y$ channels respectively, making it an ideal part for use in video systems.

The suitability for precision video applications is demonstrated further by the Y -Channel 0.1 dB gain flatness to $5.0 \mathrm{MHz}, 1.5 \%$ multiplication error, -50 dB feedthrough and differential inputs with $8 \mu \mathrm{~A}$ bias current. The HA-2556 also has low differential gain ( $0.1 \%$ ) and phase ( $0.1^{\circ}$ ) errors.

The HA-2556 is well suited for AGC circuits as well as mixer applications for sonar, radar, and medical imaging equipment. The HA-2556 is not limited to multiplication applications only; frequency doubling, power detection, as well as many other configurations are possible.

## Ordering Information

| PART <br> NUMBER <br> (Note) | PART <br> MARKING | TEMP <br> RANGE $\left({ }^{\circ}\right.$ C $)$ | PACKAGE <br> (Pb-free) | PKG <br> DWG. \# |
| :---: | :---: | :---: | :---: | :---: |
| HA9P2556-9Z | HA9P2556-9Z | -40 to +85 | 16 Ld SOIC | M16.3 |

NOTE: These Intersil Pb-free plastic packaged products employ special Pb -free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb -free products are MSL classified at Pb -free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J STD-020

## Features

- High Speed Voltage Output . . . . . . . . . . . . . . . . . 450V/ s
- Low Multiplication Error . . . . . . . . . . . . . . . . . . . . . . . 1.5\%
- Input Bias Currents . . . . . . . . . . . . . . . . . . . . . . . . . . $8 \mu \mathrm{~A}$
- 5MHz Feedthrough . . . . . . . . . . . . . . . . . . . . . . . . . 50 dB
- Wide Y-Channel Bandwidth . . . . . . . . . . . . . . . . . . 57MHz
- Wide X-Channel Bandwidth . . . . . . . . . . . . . . . . . . 52MHz
- $V_{Y} 0.1 \mathrm{~dB}$ Gain Flatness . . . . . . . . . . . . . . . . . . . . . 5.0 MHz
- Pb-free (RoHS compliant)

## Applications

- Military Avionics
- Missile Guidance Systems
- Medical Imaging Displays
- Video Mixers
- Sonar AGC Processors
- Radar Signal Conditioning
- Voltage Controlled Amplifier
- Vector Generators

Functional Block Diagram

NOTE: The transfer equation for the HA-2556 is: $\left(V_{X_{+}}-V_{X_{-}}\right)\left(V_{Y_{+}}-V_{Y_{-}}\right)=S_{F}\left(V_{Z_{+}}-V_{Z_{-}}\right)$, where $\mathrm{SF}=\mathrm{Scale}$ Factor $=5 \mathrm{~V} ; \mathrm{V}_{\mathrm{X}}, \mathrm{V}_{\mathrm{Y}}$, $\mathrm{V}_{\mathrm{Z}}=$ Differential Inputs.

4. $f=10 \mathrm{kHz}, \mathrm{V}_{\mathrm{Y}}=1 \mathrm{~V}_{\mathrm{RMS}}, \mathrm{V}_{\mathrm{X}}=5 \mathrm{~V}$.
5. $\mathrm{V}_{\text {OUT }}=0 \mathrm{~V}$ to $\pm 4 \mathrm{~V}$.
6. $V_{\text {OUT }}=0 \mathrm{mV}$ to $\pm 100 \mathrm{mV}$.
7. $\mathrm{V}_{\mathrm{S}}= \pm 12 \mathrm{~V}$ to $\pm 15 \mathrm{~V}$.
8. $V_{X}=V_{Y}=0 V$.
9. $\mathrm{V}_{\mathrm{X}}=5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{Y}}= \pm 5.5 \mathrm{~V}$.
10. Parameters with MIN and/or MAX limits are $100 \%$ tested at $+25^{\circ} \mathrm{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.

## Simplified Schematic

## Application Information

## Operation at Reduced Supply Voltages

The HA-2556 will operate over a range of supply voltages, $\pm 5 \mathrm{~V}$ to $\pm 15 \mathrm{~V}$. Use of supply voltages below $\pm 12 \mathrm{~V}$ will reduce input and output voltage ranges. See "Typical Performance Curves" on page 12 for more information.

## Offset Adjustment

X-Channel and Y-Channel offset voltages may be nulled by using a 20 k potentiometer between the $\mathrm{V}_{\mathrm{YIO}}$ or $\mathrm{V}_{\mathrm{XIO}}$ adjust pin $A$ and $B$ and connecting the wiper to $V$-. Reducing the channel offset voltage, will reduce AC feedthrough and improve the multiplication error. Output offset voltage can also be nulled by connecting $\mathrm{V}_{\mathrm{Z}^{-}}$to the wiper of a potentiometer which is tied between $\mathrm{V}+$ and V -.

## Capacitive Drive Capability

When driving capacitive loads $>20 \mathrm{pF}$ a $50 \Omega$ resistor should be connected between $\mathrm{V}_{\text {OUT }}$ and $\mathrm{V}_{\mathrm{Z}^{+}}$, using $\mathrm{V}_{\mathrm{Z}^{+}}$as the output (see Figure 1). This will prevent the multiplier from going unstable and reduce gain peaking at high frequencies. The $50 \Omega$ resistor will dampen the resonance formed with the capacitive load and the inductance of the output at Pin 8. Gain accuracy will be maintained because the resistor is inside the feedback loop.

## Theory of Operation

The HA-2556 creates an output voltage that is the product of the X and Y input voltages divided by a constant scale factor of 5 V . The resulting output has the correct polarity in each of the four quadrants defined by the combinations of positive and negative $X$ and $Y$ inputs. The $Z$ stage provides the means for negative feedback (in the multiplier configuration) and an input for summation into the output. This results in Equation 1, where $\mathrm{X}, \mathrm{Y}$ and Z are high impedance differential inputs.

FIGURE 1. DRIVING CAPACITIVE LOAD

$$
\begin{equation*}
V_{\text {OUT }}=Z=\frac{X x Y}{5} \tag{EQ.1}
\end{equation*}
$$

To accomplish this the differential input voltages are first converted into differential currents by the $X$ and $Y$ input transconductance stages. The currents are then scaled by a constant reference and combined in the multiplier core. The multiplier core is a basic Gilbert Cell that produces a differential output current proportional to the product of $X$ and Y input signal currents. This current becomes the output for the HA-2557.

The HA-2556 takes the output current of the core and feeds it to a transimpedance amplifier, that converts the current to a voltage. In the multiplier configuration, negative feedback is provided with the $Z$ transconductance amplifier by connecting $\mathrm{V}_{\text {OUT }}$ to the Z input. The $Z$ stage converts $\mathrm{V}_{\text {OUT }}$ to a current which is subtracted from the multiplier core before being applied to the high gain transimpedance amp. The $Z$ stage, by virtue of it's similarity to the $X$ and $Y$ stages, also cancels second order errors introduced by the dependence of $V_{B E}$ on collector current in the $X$ and $Y$ stages.

The purpose of the reference circuit is to provide a stable current, used in setting the scale factor to 5 V . This is achieved with a bandgap reference circuit to produce a temperature stable voltage of 1.2 V which is forced across a NiCr resistor. Slight adjustments to scale factor may be possible by overriding the internal reference with the $\mathrm{V}_{\text {REF }}$ pin. The scale factor is used to maintain the output of the multiplier within the normal operating range of $\pm 5 \mathrm{~V}$ when full scale inputs are applied.

## The Balance Concept

The open loop transfer for the HA-2556 is calculated using Equation 2:
$\mathrm{V}_{\text {OUT }}=\mathrm{A}\left[\frac{\left(\mathrm{V}_{\mathrm{X}_{+}-}-\mathrm{V}_{\mathrm{X}_{-}}\right) \times\left(\mathrm{V}_{\mathrm{Y}_{+}-} \mathrm{V}_{\mathrm{Y}_{-}}\right)}{5 \mathrm{~V}}-\left(\mathrm{V}_{\left.\mathrm{Z}_{+}-\mathrm{V}_{\mathrm{Z}_{-}}\right)}\right]\right.$
where;

$$
\begin{aligned}
& \mathrm{A}=\text { Output Amplifier Open Loop Gain } \\
& \mathrm{V}_{\mathrm{X}}, \mathrm{~V}_{\mathrm{Y}}, \mathrm{~V}_{\mathrm{Z}}=\text { Differential Input Voltages } \\
& 5 \mathrm{~V}=\text { Fixed Scaled Factor }
\end{aligned}
$$

An understanding of the transfer function can be gained by assuming that the open loop gain, A, of the output amplifier is infinite. With this assumption, any value of $\mathrm{V}_{\text {OUT }}$ can be generated with an infinitesimally small value for the terms within the brackets. Therefore we can write Equation 3:
$0=\frac{\left(\mathrm{V}_{\mathrm{X}_{+}}-\mathrm{V}_{\mathrm{X}_{-}}\right) \times\left(\mathrm{V}_{\mathrm{Y}_{+}-}-\mathrm{V}_{\mathrm{Y}_{-}}\right)}{5 \mathrm{~V}}-\left(\mathrm{V}_{\mathrm{Z}_{+}}-\mathrm{V}_{\mathrm{Z}_{-}}\right)$
which simplifies to Equation 4:
$\left(\mathrm{V}_{\mathrm{X}_{+}}-\mathrm{V}_{\mathrm{X}_{-}}\right) \times\left(\mathrm{V}_{\mathrm{Y}_{+}-} \mathrm{V}_{\mathrm{Y}_{-}}\right)=5 \mathrm{~V}\left(\mathrm{~V}_{\mathrm{Z}_{+}}-\mathrm{V}_{\mathrm{Z}_{-}}\right)$
This form of the transfer equation provides a useful tool to analyze multiplier application circuits and will be called the Balance Concept.

## Typical Applications

Let's first examine the Balance Concept as it applies to the standard multiplier configuration (Figure 2).

FIGURE 2. MULTIPLIER
Signals $A$ and $B$ are input to the multiplier and the signal $W$ is the result. By substituting the signal values into the Balance equation yields Equation 5:
(A) $\times(B)=5(W)$
(EQ. 5)

And solving for $W$ yields Equation 6:
$W=\frac{A \times B}{5}$
Notice that the output (W) enters the equation in the feedback to the $Z$ stage. The Balance Equation does not test for stability, so remember that you must provide negative feedback. In the multiplier configuration, the feedback path is connected to $\mathrm{V}_{\mathrm{Z}^{+}}$input, not $\mathrm{V}_{\mathrm{Z}^{-}}$. This is due to the inversion that takes place at the summing node just prior to the output amplifier. Feedback is not restricted to the $Z$ stage, other feedback paths are possible as in the Divider Configuration shown in Figure 3.

FIGURE 3. DIVIDER
Inserting the signal values A, B and W into the Balance Equation for the divider configuration yields Equation 7:

$$
\begin{equation*}
(-W)(B)=5 V \times(-A) \tag{EQ.7}
\end{equation*}
$$

Solving for W yields Equation 8:

$$
\begin{equation*}
W=\frac{5 A}{B} \tag{EQ.8}
\end{equation*}
$$

Notice that, in the divider configuration, signal B must remain $\geq 0$ (positive) for the feedback to be negative. If signal $B$ is negative, then it will be multiplied by the $\mathrm{V}_{\mathrm{X} \text { - }}$ input to produce positive feedback and the output will swing into the rail.

Signals may be applied to more than one input at a time as in the Squaring configuration in Figure 4:

Here the Balance equation will appear as Equation 9:

$$
\begin{equation*}
(\mathrm{A}) \times(\mathrm{A})=5(\mathrm{~W}) \tag{EQ.9}
\end{equation*}
$$

FIGURE 4. SQUARE
Which simplifies to Equation 10:
$W=\frac{A^{2}}{5}$
(EQ. 10)

The last basic configuration is the Square Root as shown in Figure 5. Here feedback is provided to both $X$ and $Y$ inputs.

FIGURE 5. SQUARE ROOT (FOR A > 0 )

The Balance equation takes the form of Equation 11:

$$
\begin{equation*}
(W) \times(-W)=5(-A) \tag{EQ.11}
\end{equation*}
$$

Which equates to Equation 12:
$W=\sqrt{5 A}$
The four basic configurations (Multiply, Divide, Square and Square Root) as well as variations of these basic circuits have many uses.

## Frequency Doubler

For example, if $A \operatorname{Cos}(\omega \tau)$ is substituted for signal $A$ in the Square function, then it becomes a Frequency Doubler and the equation takes the form of Equation 13:
$(\operatorname{ACos}(\omega \tau)) \times(\operatorname{ACos}(\omega \tau))=5(W)$
And using some trigonometric identities gives the result in Equation 14:
$W=\frac{A^{2}}{10}(1+\operatorname{Cos}(2 \omega \tau))$

## Square Root

The Square Root function can serve as a precision/wide bandwidth compander for audio or video applications. A compander improves the Signal-to-Noise Ratio for your system by amplifying low level signals while attenuating or compressing large signals (refer to Figure 17; $\mathrm{X}^{0.5}$ curve). This provides for better low level signal immunity to noise during transmission. On the receiving end, the original signal may be reconstructed with the standard Square function.

## Communications

The Multiplier configuration has applications in AM Signal Generation, Synchronous AM Detection and Phase Detection to mention a few. These circuit configurations are shown in Figures 6, 7 and 8. The HA-2556 is particularly useful in applications that require high speed signals on all inputs.

FIGURE 6. AM SIGNAL GENERATION

LIKE THE FREQUENCY DOUBLER YOU GET AUDIO CENTERED AT DC AND $2 \mathrm{~F}_{\mathrm{C}}$.

FIGURE 7. SYNCHRONOUS AM DETECTION

DC COMPONENT IS PROPORTIONAL TO COS(f)
FIGURE 8. PHASE DETECTION

Each input $X, Y$ and $Z$ have similar wide bandwidth and input characteristics. This is unlike earlier products where one input was dedicated to a slow moving control function as is required for Automatic Gain Control. The HA-2556 is versatile enough for both.

Although the $X$ and $Y$ inputs have similar AC characteristics, they are not the same. The designer should consider input parameters such as small signal bandwidth, AC feedthrough and 0.1 dB gain flatness to get the most performance from the HA-2556. The Y-Channel is the faster of the two inputs with a small signal bandwidth of typically 57 MHz vs 52 MHz for the X-Channel. Therefore in AM Signal Generation, the best performance will be obtained with the Carrier applied to the Y-Channel and the modulation signal (lower frequency) applied to the X-Channel.

## Scale Factor Control

The HA-2556 is able to operate over a wide supply voltage range $\pm 5 \mathrm{~V}$ to $\pm 17.5 \mathrm{~V}$. The $\pm 5 \mathrm{~V}$ range is particularly useful in video applications. At $\pm 5 \mathrm{~V}$ the input voltage range is reduced to $\pm 1.4 \mathrm{~V}$. The output cannot reach its full scale value with this restricted input, so it may become necessary to modify the scale factor. Adjusting the scale factor may also be useful when the input signal itself is restricted to a small portion of the full scale level. Here, we can make use of the high gain output amplifier by adding external gain resistors. Generating the maximum output possible for a given input signal will improve the Signal-to-Noise Ratio and Dynamic Range of the system. For example, let's assume that the input signals are $1 V_{\text {PEAK }}$ each then, the maximum output for the HA-2556 will be 200 mV . $(1 \mathrm{~V} \times 1 \mathrm{~V}) /(5 \mathrm{~V})=200 \mathrm{mV}$. It would be nice to have the output at the same full scale as our input, so let's add a gain of 5 as shown in Figure 9.

FIGURE 9. EXTERNAL GAIN OF 5
One caveat is that the output bandwidth will also drop by this factor of 5 . The multiplier equation then becomes Equation 15:
$W=\frac{5 A B}{5}=A \times B$

## Current Output

Another useful circuit for low voltage applications allows the user to convert the voltage output of the HA2556 to an output current. The HA-2557 is a current output version offering

100 MHz of bandwidth, but its scale factor is fixed and does not have an output amplifier for additional scaling. Fortunately, the circuit in Figure 10 provides an output current that can be scaled with the value of RCONVERT and provides an output impedance of typically $1 \mathrm{M} \Omega$. IOUT then becomes Equation 16:
$\mathrm{I}_{\text {OUT }}=\frac{\mathrm{A} \times \mathrm{B}}{5} \times \frac{1}{R_{\text {CONVERT }}}$

## Video Fader

The Video Fader circuit provides a unique function. Here Channel $B$ is applied to the minus $Z$ input in addition to the minus $Y$ input. In this way, the function in Figure 11 is generated. $\mathrm{V}_{\mathrm{MIX}}$ will control the percentage of Channel A and Channel B that are mixed together to produce a resulting video image or other signal.

FIGURE 10. CURRENT OUTPUT
The Balance equation looks like Equation 17:
$\left(\mathrm{V}_{\mathrm{MIX}}\right) \times(\mathrm{ChA}-\mathrm{ChB})=5\left(\mathrm{~V}_{\mathrm{OUT}}-\mathrm{ChB}\right)$
Which simplifies to Equation 18:
$\mathrm{V}_{\text {OUT }}=\mathrm{ChB}+\frac{\mathrm{V}_{\text {MIX }}}{5}(\mathrm{Ch} \mathrm{A}-\mathrm{ChB})$
When $\mathrm{V}_{\text {MIX }}$ is 0 V the equation becomes $\mathrm{V}_{\text {OUT }}=\mathrm{ChB}$ and ChA is removed, conversely when $\mathrm{V}_{\mathrm{MIX}}$ is 5 V the equation becomes $\mathrm{V}_{\text {OUT }}=\mathrm{ChA}$ eliminating ChB. For $\mathrm{V}_{\mathrm{MIX}}$ values 0 V $\leq \mathrm{V}_{\mathrm{MIX}} \leq 5 \mathrm{~V}$ the output is a blend of ChA and ChB.

FIGURE 11. VIDEO FADER

## Other Applications

As previously shown, a function may contain several different operators at the same time and use only one

HA-2556. Some other possible multi-operator functions are shown in Figures 12, 13 and 14.

Of course the HA-2556 is also well suited to standard multiplier applications such as Automatic Gain Control and Voltage Controlled Amplifier.

$R_{1}$ and $R_{2}$ set scale to $1 \mathrm{~V} / \%$, other scale factors possible. For $\mathrm{A} \geq 0 \mathrm{~V}$.

FIGURE 13. PERCENTAGE DEVIATION

FIGURE 14. DIFFERENCE DIVIDED BY SUM S (For $A+B \geq 0 V$ )

## Automatic Gain Control

Figure 15 shows the HA-2556 configured in an Automatic Gain Control or AGC application. The HA-5127 low noise amplifier provides the gain control signal to the X input. This control signal sets the peak output voltage of the multiplier to match the preset reference level. The feedback network around the HA-5127 provides a response time adjustment. High frequency changes in the peak are rejected as noise or the desired signal to be transmitted. These signals do not indicate a change in the average peak value and therefore no gain adjustment is needed. Lower frequency changes in the peak value are given a gain of -1 for feedback to the
control input. At DC the circuit is an integrator automatically compensating for Offset and other constant error terms.

This multiplier has the advantage over other AGC circuits, in that the signal bandwidth is not affected by the control signal gain adjustment.

FIGURE 15. AUTOMATIC GAIN CONTROL

## Voltage Controlled Amplifier

A wide range of gain adjustment is available with the Voltage Controlled Amplifier configuration shown in Figure 16. Here the gain of the HFA0002 can be swept from 20V/V to a gain of almost $1000 \mathrm{~V} / \mathrm{V}$ with a DC voltage from 0 V to 5 V .

## Wave Shaping Circuits

Wave shaping or curve fitting is another class of application for the analog multiplier. For example, where a nonlinear sensor requires corrective curve fitting to improve linearity the HA-2556 can provide nonintegral powers in the range of 1 to 2 or nonintegral roots in the range of 0.5 to 1.0 (refer to "References" on page 11). This effect is displayed in Figure 17.

FIGURE 16. VOLTAGE CONTROLLED AMPLIFIER

FIGURE 17. EFFECT OF NONINTEGRAL POWERS/ROOTS

A multiplier can't do nonintegral roots "exactly", but it can yield a close approximation. We can approximate nonintegral roots with Equations 19 and 20 of the form:
$\mathrm{V}_{\mathrm{O}}=(1-\alpha) \mathrm{V}_{\mathrm{IN}}{ }^{2}+\alpha \mathrm{V}_{\mathrm{IN}}$
$\mathrm{V}_{\mathrm{O}}=(1-\alpha) \mathrm{V}_{\mathrm{IN}}{ }^{1 / 2}+\alpha \mathrm{V}_{\mathrm{IN}}$

Figure 18 compares the function $\mathrm{V}_{\mathrm{OUT}}=\mathrm{V}_{\mathrm{IN}}{ }^{0.7}$ to the approximation $\mathrm{V}_{\mathrm{OUT}}=0.5 \mathrm{~V}_{\mathrm{IN}} 0.5+0.5 \mathrm{~V}_{\mathrm{IN}}$.

FIGURE 18. COMPARE APPROXIMATION TO NONINTEGRAL ROOT

This function can be easily built using an HA-2556 and a potentiometer for easy adjustment as shown in Figures 19 and 20. If a fixed nonintegral power is desired, the circuit shown in Figure 21 eliminates the need for the output buffer amp. These circuits approximate the function $\mathrm{V}_{I N}{ }^{M}$ where M is the desired nonintegral power or root.

FIGURE 19. NONINTEGRAL ROOTS - ADJUSTABLE

FIGURE 20. NONINTEGRAL POWERS - ADJUSTABLE

FIGURE 21. NONINTEGRAL POWERS - FIXED
$\mathrm{V}_{\text {OUT }}=\frac{1}{5}\left(\frac{R_{3}}{R_{4}}+1\right) \mathrm{V}_{\text {IN }}{ }^{2}+\left(\frac{R_{3}}{R_{4}}+1\right)\left(\frac{R_{2}}{R_{1}+R_{2}}\right) V_{\text {IN }}$
Setting:
$1-\alpha=\frac{1}{5}\left(\frac{R_{3}}{R_{4}}+1\right) \quad \alpha=\left(\frac{R_{3}}{R_{4}}+1\right)\left(\frac{R_{2}}{R_{1}+R_{2}}\right)$
Values for $\alpha$ to give a desired $M$ root or power are as follows:

| ROOTS - FIGURE 19 |  | POWERS - FIGURE 20 |  |
| :---: | :---: | :---: | :---: |
| $\mathbf{M}$ | $\alpha$ | $\mathbf{M}$ | $\alpha$ |
| 0.5 | 0 | 1.0 | 1 |
| 0.6 | $\approx 0.25$ | 1.2 | $\approx 0.75$ |
| 0.7 | $\approx 0.50$ | 1.4 | $\approx 0.50$ |
| 0.8 | $\approx 0.70$ | 1.6 | $\approx 0.30$ |
| 0.9 | $\approx 0.85$ | 1.8 | $\approx 0.15$ |
| 1.0 | 1 | 2.0 | 0 |

## Sine Function Generators

Similar functions can be formulated to approximate a SINE function converter as shown in Figure 22. With a linearly changing ( 0 V to 5 V ) input the output will follow $0^{\circ}$ to $90^{\circ}$ of a sine function ( 0 V to 5 V ) output. This configuration is theoretically capable of $\pm 2.1 \%$ maximum error to full scale.

By adding a second HA-2556 to the circuit an improved fit may be achieved with a theoretical maximum error of $\pm 0.5 \%$ as shown in Figure 23. Figure 23 has the added benefit that it will work for positive and negative input signals. This makes a convenient triangle ( $\pm 5 \mathrm{~V}$ input) to sine wave ( $\pm 5 \mathrm{~V}$ output) converter.

NOTES:

1. Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication Number 95.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed $0.15 \mathrm{~mm}(0.006$ inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25 mm ( 0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. " $L$ " is the length of terminal for soldering to a substrate.
7. " N " is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width " $B$ ", as measured 0.36 mm ( 0.014 inch ) or greater above the seating plane, shall not exceed a maximum value of $0.61 \mathrm{~mm}(0.024$ inch)
10. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
