Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## DESCRIPTION

The HCF4053B is a monolithic integrated circuit fabricated in Metal Oxide Semiconductor

technology available in DIP and SOP packages.
The HCF4053B analog multiplexer/demultiplexer is a digitally controlled analog switch having low ON impedance and very low OFF leakage current. This multiplexer circuit dissipate extremely low quiescent power over the full $V_{D D}-V_{S S}$ and $V_{D D}$ $\mathrm{V}_{\mathrm{EE}}$ supply voltage range, independent of the logic state of the control signals.
When a logic "1" is present at the inhibit input terminal all channel are off. This device is a triple 2-channel multiplexer having three separate digital control inputs, $\mathrm{A}, \mathrm{B}$, and C , and an inhibit input. Each control input selects one of a pair of channels which are connected in a single pole double-throw configuration.

TYPICAL BIAS VOLTAGES

The ADDRESS (digital-control inputs) and INHIBIT logic levels are : " 0 " $=\mathrm{V}_{\mathrm{SS}}$ and "1"= $\mathrm{V}_{\mathrm{DD}}$. The analog signal (through the TG) may swing from $V_{E E}$ to $V_{D D}$

## SPECIAL CONSIDERATIONS

Control of analog signals up to 20 V peak to peak can be achieved by digital signal amplitudes of 4.5 to 20 V (if $\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{S S}=3 \mathrm{~V}$, a $\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{E E}$ of up to 13 V can be controlled; for $\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{EE}}$ level differences above 13 V , a $\mathrm{V}_{D D}-\mathrm{V}_{S S}$ of at least 4.5 V is required. For example, if $\mathrm{V}_{\mathrm{DD}}=+5, \mathrm{~V}_{S S}=0$, and $\mathrm{V}_{\mathrm{EE}}=-13.5$, analog signals from -13.5 V to 4.5 V can be controlled by digital inputs of 0 to 4.5 V . In
certain applications, the external load resistor current may include both $V_{D D}$ and signal-line components. To avoid drawing $\mathrm{V}_{\mathrm{DD}}$ current when switch current flows into the transmission gate inputs, the voltage drop across the bidirectional switch must not exceed $0,8 \mathrm{~V}$ (calculated from $\mathrm{R}_{\mathrm{ON}}$ values shown in DC SPECIFICATIONS). No $V_{D D}$ current will flow through $R_{L}$ if the switch current flows into leads 4, 14 and 15 .
