## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## HFBR-1312TZ Transmitter <br> HFBR-2316TZ Receiver

1300 nm Fiber Optic Transmitter and Receiver

## Data Sheet

## Description

The HFBR-1312TZTransmitter and HFBR-2316TZ Receiver are designed to provide the most cost-effective 1300 nm fiber optic links for a wide variety of data communication applications from low-speed distance extenders up to SONET OC-3 signal rates. Pinouts identical to Avago HFBR$0400 Z$ Series allow designers to easily upgrade their 820 nm links for farther distance. The transmitter and receiver are compatible with two popular optical fiber sizes: $50 / 125 \mu \mathrm{~m}$ and $62.5 / 125 \mu \mathrm{~m}$ diameter. This allows flexibility in choosing a fiber size. The 1300 nm wavelength is in the lower dispersion and attenuation region of fiber, and provides longer distance capabilities than 820 nm LED technology. Typical distance capabilities are 2 km at 125 MBd and 5 km at 32 MBd .

## Features

- RoHS-compliant
- Low cost fiber optic link
- Signal rates over 155 megabaud
- 1300 nm wavelength
- Link distances up to 5 km
- Dual-in-line package panel-mountable ST* port
- Auto-insertable and wave-solderable
- Specified with $62.5 / 125 \mu \mathrm{~m}$ and $50 / 125 \mu \mathrm{~m}$ fiber
- Compatible with 820 nm Miniature Link Series
- Receiver also specified for SM cable spec (9/125 $\mu \mathrm{m}$ )

## Applications

- Desktop links for high speed LANs
- Distance extension links
- Telecom switch systems
- TAXIchip ${ }^{\circledR}$ compatible

## Transmitter

The HFBR-1312TZ fiber optic transmitter contains a 1300 $\mathrm{nm} \operatorname{InGaAsP}$ light emitting diode capable of efficiently launching optical power into $50 / 125 \mu \mathrm{~m}$ and $62.5 / 125$ $\mu \mathrm{m}$ diameter fiber. Due to the pin compatibility to the 820 nm Miniature Link Series, converting the driver circuit from a HFBR-14xxZ 820 nm transmitter to the HFBR1312TZ requires the modification of only a few passive components.

## Receiver

The HFBR-2316TZ receiver contains an InGaAs PIN photodiode and a low-noise transimpedance preamplifier that operate in the 1300 nm wavelength region. The HFBR-2316TZ receives an optical signal and converts it to an analog voltage. The buffered output is an emitterfollower, with frequency response from DC to typically 125 MHz . Low-cost external components can be used to convert the analog output to logic compatible signal levels for a variety of data formats and data rates. Due to the pin compatibility to the 820 nm Miniature Link receiver HFBR-2416xxZ, converting from a 820 nm to a 1300 nm receiver circuit is realizable by replacing the HFBR-2416xxZ with the HFBR-2316TZ.

## HFBR-1312TZ Transmitter

## HFBR-2316TZ Receiver

| PIN | FUNCTION |
| :---: | :---: |
| 1 | N.C. |
| 2 | SIGNAL |
| $3^{*}$ | V $_{\text {EE }}$ |
| 4 | N.C. |
| 5 | N.C. |
| 6 | V CC $^{\text {Cl }}$ |
| $7^{*}$ | V $_{\text {EE }}$ |
| 8 | N.C. |

* PINS 3 AND 7 ARE ELECTRICALLY CONNECTED TO THE HEADER.

PINS 1, 4, 5, AND 8 ARE ISOLATED FROM THE INTERNAL CIRCUITRY, BUT ARE ELECTRICALLY CONNECTED TO EACH OTHER.

Mechanical Dimensions

[^0]
## Package Information

The transmitter and receiver are housed in a dual-in-line package made of high strength, heat resistant, chemically resistant, and UL V-0 flame retardant plastic. The package is auto-insertable and wave solderable for high volume production applications.

Note:The" $T$ "in the product numbers indicates a Threaded ST connector (panel mountable), for both transmitter and receiver.

## Handling and Design Information

When soldering, it is advisable to leave the protective cap on the unit to keep the optics clean. Good system performance requires clean port optics and cable ferrules to avoid obstructing the optical path. Clean compressed air is often sufficient to remove particles of dirt; methanol on a cotton swab also works well.

## Recommended Chemicals for Cleaning/Degreasing

Alcohols (methyl, isopropyl, isobutyl)
Aliphatics (hexane, heptane)
Other (soap solution, naphtha)
Do not use partially halogenated hydrocarbons (such as 1.1.1 trichloroethane), ketones (such as MEK), acetone, chloroform, ethyl acetate, methylene dichloride, phenol, methylene chloride, or N-methylpyrolldone. Also, Avago does not recommend the use of cleaners that use halogenated hydrocarbons because of their potential environmental harm.

## Panel Mounting Hardware

The HFBR-4411Z kit consists of 100 nuts and 100 washers with dimensions as shown in Figure 1. These kits are available from Avago or any authorized distributor. Any standard size nut and washer will work, provided the total thickness of the wall, nut, and washer does not exceed 0.2 inch ( 5.1 mm ).

When preparing the chassis wall for panel mounting, use the mounting template in Figure 2. When tightening the nut, torque should not exceed $0.8 \mathrm{~N}-\mathrm{m}(8.0 \mathrm{in}-\mathrm{lb})$.

Notes:

1. 2.0 mm from where leads enter case.

CAUTION: The small junction sizes inherent to the design of this bipolar component increase the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

| Rise Time | $\mathrm{t}_{\mathrm{r}}$ |  | 1.8 | 4.0 | ns | $0-70^{\circ} \mathrm{C}$ | 75 mA | Note 6 Fig. 5 |
| Fall Time | $\mathrm{t}_{\text {f }}$ |  | 2.2 | 4.0 | ns | $0-70^{\circ} \mathrm{C}$ | 75 mA | Note 6 Fig. 5 |

## Notes:

1. Typical data are at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.
2. Optical power is measured with a large area detector at the end of 1 meter of mode stripped cable, with an $\mathrm{ST}^{*}$ precision ceramic ferrule (MIL-STD-83522/13), which approximates a standard test connector. Average power measurements are made at 12.5 MHz with a $50 \%$ duty cycle drive current of 0 to $I_{\text {Fpeak }} I_{\text {F,average }}=I_{\text {Fpeak }} / 2$. Peak optical power is 3 dB higher than average optical power.
3. When changing from $\mu \mathrm{W}$ to dBm , the optical power is referenced to $1 \mathrm{~mW}(1000 \mu \mathrm{~W})$.

Optical power $\mathrm{P}(\mathrm{dBm})=10^{*} \log [\mathrm{P}(\mu \mathrm{W}) / 1000 \mu \mathrm{~W}]$.
4. Fiber NA is measured at the end of 2 meters of mode stripped fiber using the far-field pattern. NA is defined as the sine of the half angle, determined at $5 \%$ of the peak intensity point. When using other manufacturer's fiber cable, results will vary due to differing NA values and test methods.
5. Overshoot is measured as a percentage of the peak amplitude of the optical waveform to the $100 \%$ amplitude level. The $100 \%$ amplitude level is determined at the end of a 40 ns pulse, $50 \%$ duty cycle. This will ensure that ringing and other noise sources have been eliminated.
6. Optical rise and fall times are measured from $10 \%$ to $90 \%$ with $62.5 / 125 \mu \mathrm{~m}$ fiber. LED response time with recommended test circuit (Figure 3) at $25 \mathrm{MHz}, 50 \%$ duty cycle.

Figure 4. Normalized transmitter output power vs. forward current

Figure 5. Recommended transmitter drive and test circuit

HFBR-2316TZ Receiver Absolute Maximum Ratings

| Parameter | Symbol | Min. | Max. | Unit | Reference |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Storage Temperature | $\mathrm{T}_{\mathrm{S}}$ | -55 | 85 | ${ }^{\circ} \mathrm{C}$ |  |
| Operating Temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |  |
| Lead Soldering Temperature |  |  | 260 | ${ }^{\circ} \mathrm{C}$ | Note 1 |
| Cycle Time |  |  | 10 | s |  |
| Signal Pin Voltage | $\mathrm{V}_{\mathrm{o}}$ | -0.5 | $\mathrm{~V}_{\mathrm{CC}}$ | V |  |
| Supply Voltage | $\mathrm{V}_{\mathrm{CC}}-\mathrm{V}_{\mathrm{EE}}$ | -0.5 | 6.0 | V | Note 2 |
| Output Current | $\mathrm{I}_{\mathrm{O}}$ |  | 25 | mA |  |

Notes:

1. 2.0 mm from where leads enter case.
2. The signal output is referred to $\mathrm{V}_{\mathrm{cc}}$, and does not reject noise from the $\mathrm{V}_{\mathrm{cc}}$ power supply. Consequently, the $\mathrm{V}_{\mathrm{cc}}$ power supply must be filtered. The recommended power supply is +5 V on $\mathrm{V}_{\mathrm{CC}}$ for typical usage with +5 VECL logic. $\mathrm{A}-5 \mathrm{~V}$ power supply on $\mathrm{V}_{\mathrm{EE}}$ is used for test purposes to minimize power supply noise.

CAUTION: The small junction sizes inherent to the design of this bipolar component increase the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

| Overshoot |  |  | 2 |  | \% | $P_{R}=-15 \mathrm{dBm}$, peak | Note 8 |

## Notes:

1. Typical specifications are for operation at $T_{A}=25^{\circ} \mathrm{C}$ and $\mathrm{V}_{\mathrm{CC}}=+5 \mathrm{~V}_{\mathrm{DC}}$.
2. The test circuit layout should be in accordance with good high frequency circuit design techniques.
3. Measured with a 9-pole "brick wall" low-pass filter [Mini-Circuits ${ }^{\top M}$, BLP-100*] with -3 dB bandwidth of 100 MHz .
4. -11.0 dBm is the maximum peak input optical power for which pulse-width distortion is less than 1 ns .
5. Electrical bandwidth is the frequency where the responsivity is -3 dB (electrical) below the responsivity measured at 50 MHz .
6. The specifled rise and fall times are referenced to a fast square wave optical source. Rise and fall times measured using an LED optical source with a 2.0 ns rise and fall time (such as the HFBR-1312TZ) will be approximately 0.6 ns longer than the specifled rise and fall times. E.g.: measured $t_{r, f} \sim\left[\left(\text { specifled } t_{r, f}\right)^{2}+\left(\text { test source optical } t_{r, f}\right)^{2}\right]^{1 / 2}$.
7. 10 ns pulse width, $50 \%$ duty cycle, at the $50 \%$ amplitude point of the waveform.
8. Percent overshoot is defined as: $\left(\left(\mathrm{V}_{\mathrm{PK}}-\mathrm{V}_{100 \%}\right) / \mathrm{V}_{100 \%}\right) \times 100 \%$. The overshoot is typically $2 \%$ with an input optical rise time $\leq 1.5 \mathrm{~ns}$.
9. The bandwidth*risetime product is typically 0.41 because the HFBR-2316TZ has a second-order bandwidth limiting characteristic.
10. The signal output is referred to $\mathrm{V}_{c C^{\prime}}$ and does not reject noise from the $\mathrm{V}_{\mathrm{cc}}$ power supply. Consequently, the $\mathrm{V}_{\mathrm{cc}}$ power supply must be filtered. The recommended power supply is +5 V on $\mathrm{V}_{\mathrm{CC}}$ for typical usage with +5 VECL logic. $\mathrm{A}-5 \mathrm{~V}$ power supply on $\mathrm{V}_{\mathrm{EE}}$ is used for test purposes to minimize power supply noise.
