### Functional Diagram

### General Description

The HMC334LP4(E) is a low noise, wideband downconverter RFIC which is ideal for Cellular/3G and WiMAX/4G applications from 0.6 to 2.7 GHz. The LO input accepts drive levels from -6 to +6 dBm while the RFIC provides 48 dB of LO to RF isolation, and 0 dB conversion loss. The HMC334LP4(E) will support an IF output bandwidth of up to 600 MHz and consumes only 173 mA from a +5V supply. This wideband active mixer also provides excellent performance in the presence of high level "Blocker" signals, making it ideal for receiver applications in demanding environments.

### Pin Descriptions

Pin Number	Function	Description	Interface Schematic
1	VccLO	Supply for LO Amplifier. Draws approximately 120mA from VSLO. A 13 Ohm resistor (R1) must be connected externally between the VSLO supply and the VccLO pin. See evaluation PCB schematic.	
2, 5, 8, 11, 14, 17, 20, 23	GND	These pins and the ground paddle should be connected to a high quality RF/DC ground.	
3	LOP	LO Input Port. This pin needs a DC blocking capacitor. (Typical voltage on this pin will be 1.5 - 1.8V)	
4	LON	For single ended applications, this pin should be AC grounded	
6, 7, 12, 21, 22, 24	N/C	The pins are not connected internally; however, all data shown herein was measured with these pins connected to RF/DC ground externally.	
9, 10	IFN, IFP	Differential baseband outputs, 200 ohm differential output impedance. Each port should draw approximately 25mA from VSIF without LO power and 28mA from VSIF with LO power on.  For single-ended 50 Ohm operation, port J2 or J3 should be shorted to RF/DC ground. See evaluation PCB schematic.	
13, 18	CTRF	Center tap of the RF transformer. Biased at 2.2V when connected to ground through two 91 ohm resistors.	
15	GNDRF	Pin to be connected to a high quality RF/DC ground. Also can be used to drive the RF port differentially if needed.	
16	RF	50 Ohms impedance can be matched from 600 - 3000 MHz.	
19	VccIF	Supply decoupling for the mixer stage. (Typical voltage on this pin will be 4.8V) Connect C3 to a high quality RF/DC ground per evaluation PCB schematic.

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
