### Functional Diagram

### General Description

The HMC625LP5(E) is a digitally controlled variable gain amplifier which operates from DC to 6 GHz, and can be programmed to provide anywhere from 13.5 dB attenuation, to 18 dB of gain, in 0.5 dB steps. The HMC625LP5(E) delivers noise figure of 6 dB in its maximum gain state, with output IP3 of up to +33 dBm in any state. The dual mode control interface is CMOS/TTL compatible, and accepts either a three wire serial input or a 6 bit parallel word. The HMC625LP5(E) also features a user selectable power up state and a serial output port for cascading other Hittite serial controlled components. The HMC625LP5(E) is housed in a RoHS compliant 5x5 mm QFN leadless package, and requires no external matching components.

### Serial Control Interface

The HMC625LP5(E) contains a 3-wire SPI compatible digital interface (SERIN, CLK, LE). It is activated when P/S is kept high. The 6-bit serial word must be loaded MSB first. The positive-edge sensitive CLK and LE requires clean transitions. If mechanical switches were used, sufficient debouncing should be provided. When LE is high, 6-bit data in the serial input register is transferred to the attenuator. When LE is high CLK is masked to prevent data transition during output loading.

When P/S is low, 3-wire SPI interface inputs (SERIN, CLK, LE) are disabled and serial input register is loaded asynchronously with parallel digital inputs (D0-D5). When LE is high, 6-bit parallel data is transferred to the attenuator.

For all modes of operations, the DVGA state will stay constant while LE is kept low.

**Timing Diagram (Latched Parallel Mode)**

Parameter	Typ.
Min. serial period, $t_{SCK}$	100 ns
Control set-up time, $t_{CS}$	20 ns
Control hold-time, $t_{CH}$	20 ns
LE setup-time, $t_{LN}$	10 ns
Min. LE pulse width, $t_{LEW}$	10 ns
Min LE pulse spacing, $t_{LES}$	630 ns
Serial clock hold-time from LE, $t_{CKN}$	10 ns
Hold Time $t_{PH}$	0 ns
Latch Enable Minimum width, $t_{LEN}$	10 ns
Setup Time, $t_{PS}$	2 ns

### Parallel Mode (Direct Parallel Mode & Latched Parallel Mode)

**Note:** The parallel mode is enabled when P/S is set to low.

**Direct Parallel Mode** - The attenuation state is changed by the Control Voltage Inputs directly. The LE (Latch Enable) must be at a logic high to control the attenuator in this manner.

**Latched Parallel Mode** - The attenuation state is selected using the Control Voltage Inputs and set while the LE is in the Low state. The attenuator will not change state while LE is Low. Once all Control Voltage Inputs are at the desired states the LE is pulsed. See timing diagram above for reference.

**Power-Up States**

If LE is set to logic LOW at power-up, the logic state of PUP1 and PUP2 determines the power-up state of the part per PUP truth table. If the LE is set to logic HIGH at power-up, the logic state of D0-D5 determines the power-up state of the part per truth table. The DVGA latches in the desired power-up state approximately 200 ms after power-up.

**Power-On Sequence**

The ideal power-up sequence is: GND, Vdd, digital inputs, RF inputs. The relative order of the digital inputs are not important as long as they are powered after Vdd / GND

**Absolute Maximum Ratings**

RF Input Power [1]	11.5 dBm (T = 85 °C)

Note: The logic state of D0 - D5 determines the power-up state per truth table shown below when LE is high at power-up.

**Truth Table**

Control Voltage Input						Gain Relative to Maximum Gain
D5	D4	D3	D2	D1	D0	
High	High	High	High	High	High	0 dB

High	Low	High	High	High	High	-8 dB
Low	High	High	High	High	High	-16 dB
Low	Low	Low	Low	Low	Low	-31.5 dB

Any combination of the above states will provide a reduction in gain approximately equal to the sum of the bits selected.

[2] Circuit Board Material: Arlon 25FR

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
