

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

FEATURES

- 32 dBm typical saturated output power (P_{SAT}) at 18% power added efficiency (PAE) at 39 GHz**
- P1dB compression output power: 31.5 dBm typical**
- High output third-order intercept (IP3): 40 dBm typical**
- High gain: 24 dB typical**
- 50 Ω matched input/output**
- Ceramic, 6 mm \times 6 mm, high frequency, air cavity package**

APPLICATIONS

- Point to point radios**
- Point to multipoint radios**
- Very small aperture terminal (VSAT) and satellite communications (SATCOM)**

GENERAL DESCRIPTION

The [HMC7229LS6](#) is a four stage, gallium arsenide (GaAs), pseudomorphic high electron mobility transfer (pHEMT), monolithic microwave integrated circuit (MMIC), 1 W power amplifier, with an integrated temperature compensated on-chip power detector that operates between 37 GHz to 40 GHz. The [HMC7229LS6](#) provides 24 dB of gain and 32 dBm of saturated output power at 18% PAE at 39 GHz from a 6 V supply. With an excellent IP3 of 40 dBm, the [HMC7229LS6](#) is ideal for linear

applications such as high capacity, point to point or multipoint radios or VSAT/SATCOM applications demanding 32 dBm of efficient saturated output power. The radio frequency (RF) input/outputs are internally matched and dc blocked for ease of integration into higher level assemblies. The [HMC7229LS6](#) is housed in a ceramic, 6 mm \times 6 mm, high frequency, air cavity package that exhibits low thermal resistance and is compatible with surface-mount manufacturing techniques.

SPECIFICATIONS

ELECTRICAL SPECIFICATIONS

$T_A = 25^\circ\text{C}$, V_{DD1} to V_{DD4} (V_{DDX}) = 6 V, $I_{DD} = 1200$ mA (adjust V_{GG1}/V_{GG2} , V_{GGX} , between -2 V to 0 V to achieve an $I_{DD} = 1200$ mA typical), unless otherwise stated.

Table 1.

Parameter	Test Conditions/Comments	Min	Typ	Max	Unit
FREQUENCY RANGE		37		40	GHz
GAIN		21	24		dB
Gain Variation over Temperature			0.058		dB/°C
RETURN LOSS					
Input			16		dB
Output			14		dB
OUTPUT POWER					
For P1dB Compression		28.5	31.5		dBm
Saturated (P_{SAT})	With 18% PAE at 39 GHz		32		dBm
OUTPUT THIRD-ORDER INTERCEPT (IP3)	Measurement taken at $P_{OUT}/\text{tone} = 20$ dBm		40		dBm
TOTAL SUPPLY CURRENT (I_{DD}) ¹	$V_{DD} = 5$ V, $V_{DD} = 5.5$ V, and $V_{DD} = 6$ V		1200		mA

¹ Adjust V_{GGX} to achieve $I_{DD} = 1200$ mA.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Drain Bias Voltage (V_{DDX})	7 V
RF Input Power (RFIN)	21 dBm
Channel Temperature	175°C
Continuous Power Dissipation, P_{DISS} (T = 85°C, Derates 95 mW/°C Above 85°C)	9.0 W
Thermal Resistance (Channel to Ground Paddle)	10°C/W
Storage Temperature Range	-65°C to +150°C
Operating Temperature Range	-40°C to +85°C
ESD Sensitivity (Human Body Model)	Class 0, passed 150 V

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

- NOTES**
1. NIC = NO INTERNAL CONNECTION. NOTE THAT DATA SHOWN HEREIN WAS MEASURED WITH THESE PINS EXTERNALLY CONNECTED TO RF/DC GROUND.
 2. EXPOSED PAD. THE EXPOSED PAD MUST BE CONNECTED TO RF/DC GROUND.

Figure 2. Pin Configuration

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1, 2, 10, 11	V _{DD1} to V _{DD4}	Drain Bias Voltages. External bypass capacitors of 100 pF, 10 nF, and 4.7 μF are required for each of these pins. See Figure 3.
3, 9	V _{GG1} , V _{GG2}	Gate Controls for the Power Amplifier. Adjust V _{GGX} to achieve the recommended bias current. External bypass capacitors of 100 pF, 10 nF, and 4.7 μF are required for each of these pins. Apply V _{GGX} bias to either Pin 3 or Pin 9. See Figure 4.
4, 8	NIC	No Internal Connection. Note that data shown herein was measured with these pins externally connected to RF/dc ground.
5, 7, 13, 15	GND	Ground Pins. Connect these pins and the exposed ground pad to RF/dc ground. See Figure 5.
6	RFIN	RF Input. This pin is ac-coupled and matched to 50 Ω. See Figure 6.
12	V _{DET}	Detector Voltage. This pin is the dc voltage that represents the RF output power rectified by the diode that is biased through an external resistor. See Figure 8.
14	RFOUT	RF Output. This pin is ac-coupled and matched to 50 Ω. See Figure 9.
16	V _{REF}	Detector Reference Voltage. This pin is the dc voltage of the diode biased through an external resistor used for the temperature compensation of V _{DET} . See Figure 7.
	EPAD	Exposed Pad. The exposed pad must be connected to RF/dc ground.

THEORY OF OPERATION

The [HMC7229LS6](#) is gallium arsenide (GaAs), pseudomorphic high electron mobility transfer (pHEMT), monolithic microwave integrated circuit (MMIC), 1 W power amplifier consisting of four gain stages that are in series. Figure 33 shows the simplified block diagram.

The input signal is divided evenly into two, each of these paths are amplified through four independent gain stages, and the amplified signals are then combined at the output.

The [HMC7229LS6](#) has single-ended input and output ports whose impedances are nominally matched to 50 Ω internally over the 37 GHz to 40 GHz frequency range. Consequently, the [HMC7229LS6](#) can directly insert into a 50 Ω system with no

impedance matching circuitry required. In addition, multiple [HMC7229LS6](#) devices can be cascaded back to back without requiring external matching circuitry. Similarly, multiple [HMC7229LS6](#) devices can be used with power dividers at the input and power combiners at the output to obtain higher output power levels.

Because the input and output impedances are sufficiently stable vs. the variations in temperature and supply voltage, no impedance matching compensation is required.

To achieve the best performance and not damage the [HMC7229LS6](#), do not exceed the absolute maximum ratings.

Figure 33. GaAs, pHEMT, 1 W MMIC Power Amplifier Block Diagram

APPLICATIONS INFORMATION

Figure 35 shows the basic connections for operating the [HMC7229LS6](#) and see the Theory of Operation section for additional details. The RF input and RF output are ac-coupled by the internal dc block capacitors. To avoid damaging the [HMC7229LS6](#), follow the recommended bias sequencing during power-up and power-down.

The gate bias of the [HMC7229LS6](#) is supplied by using either the V_{GG1} pin or the V_{GG2} pin. While applying drain bias to the [HMC7229LS6](#), all of the V_{DD1} , V_{DD2} , V_{DD3} , and V_{DD4} pins must be used.

RECOMMENDED BIAS SEQUENCE

During Power-Up

The recommended bias sequence during power-up is the following:

1. Connect the GND pin to ground.
2. Set V_{GGX} to -2 V.
3. Set V_{DDX} to 6 V.
4. Increase V_{GGX} to achieve a typical $I_{DD} = 1200$ mA.
5. Apply the RF signal.

During Power-Down

The recommended bias sequence during power-down is the following:

1. Turn the RF signal off.
2. Decrease V_{GGX} to -2 V to achieve a typical $I_{DD} = 0$ mA.
3. Decrease V_{DDX} to 0 V.
4. Increase V_{GGX} to 0 V.

The bias conditions previously listed ($V_{DDX} = 6$ V, $I_{DD} = 1200$ mA), are the recommended operating point to get optimum performance. The data used in this data sheet was taken with the recommended bias condition. When using the [HMC7229LS6](#) with different bias conditions, different performance may result than what is shown in the Typical Performance Characteristics section.

The V_{DET} and V_{REF} pins are the output pins for the internal power detector. The V_{DET} pin is the dc voltage output pin that represents the RF output power rectified by the internal diode, which is biased through an external resistor.

The V_{REF} pin is the dc voltage output pin that represents the reference diode voltage, which is biased through an external resistor. This voltage then compensates for the temperature variation effects on both diodes. A typical circuit is shown in the Typical Application Circuit section that reads out the output voltage and represents the RF output power shown in Figure 35.

EVALUATION PRINTED CIRCUIT BOARD (PCB)

Use RF circuit design techniques to create the circuit board for this application. Ensure that signal lines have 50 Ω impedance, and connect the package ground leads and exposed paddle directly to the ground plane similar to that shown in Figure 35.

Use a sufficient number of via holes to connect the top and bottom ground planes. The evaluation circuit board shown in Figure 34 is available from Analog Devices, Inc., upon request.
