General Description

The HMC943ALP5DE is a four stage pHEMT MMIC 1.5 Watt Power Amplifier which operates between 24 and 34 GHz. The HMC943ALP5DE provides 23 dB of gain, and +33 dBm of saturated output power and 23% PAE from a +5.5V supply. The high output IP3 of +41 dBm makes the HMC943ALP5DE ideal for microwave radio applications. A power Detector output is also available The HMC943ALP5DE amplifier I/Os are internally matched to 50 Ohms and is packaged in a leadless QFN 5 x 5 mm surface mount package and requires no external matching components.

Pin Descriptions

Pin Number	Function	Description	Interface Schematic
1, 3, 5, 8, 9, 16, 17, 20, 22, 24, 25, 32	GND	These pins and package bottom must be connected to RF/DC ground.	
2, 6, 7, 14, 23, 27	N/C	These pins are not connected internally;however, all data shown herein was measured with these pins connected to RF/DC ground externally.	
4	RFIN	RF signal input. This pad is AC coupled and matched to 50 Ohms over the operating frequency range.	18	VREF	Reference diode used for temperature compensation of VDET RF output power measurements. Used in combination with VDET, this voltage provides temperature compensation to VDET RF output power measurements. See Figure B for the VREF interface schematic..	19	VDET	Detector diode used for measurement of the RF output power. Detection via this pin requires the application of a DC bias voltage through an external series resistor. Used in combination with VREF, the difference voltage VREF-VDET is a temperature compensated DC voltage proportional to the RF output power. See Figure A for the VDET interface schematic.	10, 31	VG1, VG2	Gate control for amplifier. External bypass capacitors of 100 pF, 0.01 µF, and 4.7 µF are required on each. NOTE: VG1 & VG2 are internally connected. So external bias can be applied to either VG1 or VG2	11 - 13, 15, 26, 28 - 30	VD2, VD4, VD6, VD8, VD7, VD5, VD3, VD1	Drain bias for the amplifier. External bypass capacitors of 100 pF, 0.01 µF, and 4.7 µF are required on each.	21	RFOUT	RF signal output. This pad is AC coupled and matched to 50 ohms over the operating frequency range.

[2] Circuit Board Material: Rogers 4350 or Arlon FR4

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 Ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation board should be mounted to an appropriate heat sink. The evaluation circuit board shown is available from Analog Devices upon request.
