# imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# **Important User Information**

## Liability

Every care has been taken in the preparation of this document. Please inform HMS Industrial Networks AB of any inaccuracies or omissions. The data and illustrations found in this document are not binding. We, HMS Industrial Networks AB, reserve the right to modify our products in line with our policy of continuous product development. The information in this document is subject to change without notice and should not be considered as a commitment by HMS Industrial Networks AB. HMS Industrial Networks AB assumes no responsibility for any errors that may appear in this document.

There are many applications of this product. Those responsible for the use of this device must ensure that all the necessary steps have been taken to verify that the applications meet all performance and safety requirements including any applicable laws, regulations, codes, and standards.

HMS Industrial Networks AB will under no circumstances assume liability or responsibility for any problems that may arise as a result from the use of undocumented features, timing, or functional side effects found outside the documented scope of this product. The effects caused by any direct or indirect use of such aspects of the product are undefined, and may include e.g. compatibility issues and stability issues.

The examples and illustrations in this document are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular implementation, HMS Industrial Networks AB cannot assume responsibility for actual use based on these examples and illustrations.

## **Intellectual Property Rights**

HMS Industrial Networks AB has intellectual property rights relating to technology embodied in the product described in this document. These intellectual property rights may include patents and pending patent applications in the USA and other countries.

 ${ig(i)}$  This is additional information which may facilitate installation and/or operation.

This instruction must be followed to avoid a risk of reduced functionality and/or damage to the equipment, or to avoid a network security risk.

#### Caution

This instruction must be followed to avoid a risk of personal injury.

#### WARNING

This instruction must be followed to avoid a risk of death or serious injury.

## 2 EtherNet/IP to PROFIBUS DP Linking Device

#### 2.1 Introduction

The EtherNet/IP to PROFIBUS DP Linking Device is used to provide a seamless connection between a PROFIBUS network and an EtherNet/IP network. The linking device enables the master of the EtherNet/IP network to control the PROFIBUS network, and data can be transmitted transparently between the two networks.

#### 2.2 Features

#### 2.2.1 The EtherNet/IP to PROFIBUS DP Linking Device

Up to 7000 bytes IO data

3500 bytes in each direction over multiple IO connections on EtherNet/IP.

Routing of acyclic data

Predefined CIP objects available for specific PROFIBUS DPV1 Class 1 and Class 2 read and write requests. These are accessed either by the PLC through CIP Message Instructions from Studio 5000 Logix Designer or from within the Custom Add-On Profile network configuration software by the system integrator

- Control/Status information added to the I/O data for diagnostic purposes
- Live List of the active status of the connected slaves
- Configuration through Customer Add-On Profile for Studio 5000 Logix Designer for Device and Network configuration of the PROFIBUS network and data structures for Studio 5000

#### 2.2.2 EtherNet/IP Adapter Class Product Specifics

- Beacon Based DLR (Device Level Ring) and linear network topology supported
- 10/100 Mbit, full/half duplex operation
- Dual port cut-through switch
- ODVA Conformance tested

#### 2.2.3 PROFIBUS DP Master Specifics

- Complete PROFIBUS DP Master functionality according to IEC 61158
- Controls up to 125 slaves
- Acyclic Communication (DP-V1, Class 1 & 2)
- Supports all common baudrates up to 12Mbps
- Galvanically isolated PROFIBUS interface

#### 2.2.4 Custom Add-On Profile for Studio 5000

- Contains a unique tag editor for uplink PLC data structuring
- Contains the PROFIBUS DP Master configuration tool
- Contains IP Config utility
- Backup of configuration data into Studio 5000 project and stored in the Controller memory
- Dynamically generates data structures based on the configuration

- Automatic generation of named and structured Studio 5000 Controller Tags. Possible to manually edit generated tag names if desired
- Possible to Group tags by Slave which creates substructures per slave in Studio 5000
- · Possible to exclude defined tags to minimize the amount of tags in PLC
- · Possible to pack selected tags into arrays of tags to minimize the amount of tags in PLC
- All network and device level configuration is done within Studio 5000
- No need for any separately installed software or additional licenses

#### 2.2.5 Other

- USB for firmware download
- ODVA, CE, UL, ATEX and Haz.Loc. certifications available

#### 2.3 Unique Integration into Studio 5000

The EtherNet/IP to PROFIBUS DP Linking Device features a custom add-on profile (AOP) for easy integration with Studio 5000. Within this add-on profile (AOP), the HMS configuration tool can be launched. When the configuration is ready, it can automatically be translated to structured Studio 5000 controller tags.

All network and device level configuration is done within Studio 5000.

The add-on profile is supported by RSLogix 5000, v20 and later.

## 2.4 Data Mapping

Į

PROFIBUS slots are assembled in multiple Class 1 Exclusive Owner (IO) Connections, on the EtherNet/IP side. There are a maximum of 10 available connections (with an associated input and output connection parameter per each) available. Each connection can manage up to a maximum of 500 bytes input data and 496 bytes output data. In total, all 10 connections can manage 3500 bytes input data and 3500 bytes output data.

Class 1 Exclusive Owner Connection	Connection Parameter	Assembly Instance	Data Size
Connection 1	Input Data	100	≤500
Connection	Output Data	150	≤496
Connection 2	Input Data	101	≤500
Connection 2	Output Data	151	≤496
Connection 2	Input Data	102	≤500
Connection 3	Output Data	152	≤496
Connection 4	Input Data	103	≤500
Connection 4	Output Data	153	≤496
Connection F	Input Data	104	≤500
Connection 5	Output Data	154	≤496
	Input Data		≤500
	Output Data		≤496
	Input Data	109	≤500
Connection 10	Output Data	159	≤496

Connections will be made as needed. If a PROFIBUS slot does not fit into the remaining parts of a connection, it will be moved to the next connection. Every slot will always be checked against already existing connections. If it fits in the unused space of an earlier connection, it will be put there.

## 2.5 Configuring the EtherNet/IP Network

The Linking Device is an EtherNet/IP adapter (slave) on the EtherNet/IP network. The general settings for the adapter interface are configured using the configuration pages. All data transfers must be configured in Studio 5000. Please note that the size of the I/O data that can be read from and written to the module is defined when configuring the linking device using the configuration pages.

#### 2.6 Control Word

16 bit control word sent to the linking device from the PLC or EtherNet/IP scanner.

Bit(s)	Name	Description
0-1	Run mode	0 - PROFIBUS is set to IDLE 1 - PROFIBUS is set to OPERATE 2 - PROFIBUS is set to STOP
2-15	-	Bits are unused

## 2.7 Status Word

16 bit status word sent from the linking device to the EtherNet/IP scanner or PLC.

Bit(s)	Name	Description
0-1	Run mode	0 - PROFIBUS in IDLE (or not initialized) 1 - PROFIBUS is set in OPERATE 2 - PROFIBUS is set in STOP
2	CFG error	<ul><li>0 - Configuration is valid and in use.</li><li>1 - Configuration is either missing or invalid.</li></ul>
3-15	-	-

## 2.8 PROFIBUS Slave Live List

The PROFIBUS slave live list consists of a 16 byte bit-field, where each bit corresponds to one slave on the PROFIBUS network. Each bit is linked to one specific PROFIBUS node address, according to the table below.

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Slave 7	Slave 6	Slave 5	Slave 4	Slave 3	Slave 2	Slave 1	Slave 0
1	Slave 15	Slave 14	Slave 13	Slave 12	Slave 11	Slave 10	Slave 9	Slave 8
2-14								
15	Slave 127	Slave 126	Slave 125	Slave 124	Slave 123	Slave 122	Slave 121	Slave 120

## 3 About the Linking Device

### 3.1 External View

#### A: Power Connector

This connector is used to apply power to the linking device. It is also possible to connect protective earth (PE) to the power connector.

#### B: SD Card Slot

Currently not in use.

#### C: USB Port

This port adds the possibility to connect a PC to the linking device to perform firmware upgrades.

#### E: DIN Rail Connector

The DIN-rail mechanism fastens the linking device to a DIN-rail and connects the module to protective earth (PE).

F: EtherNet/IP Connectors

**G: PROFIBUS Connector** 

## 3.2 Mounting the Linking Device

The EtherNet/IP to PROFIBUS DP Linking Device can be physically installed either by mounting it onto a DIN-rail or, if installed in areas exposed to vibration, by mounting it on a wall for more stability.

#### 3.2.1 DIN-rail Mounting

Make sure the DIN-rail fastening mechanism on the back of the module is in a fixed and closed position, i. e. pushed all the way up.

To mount the module, first hook it on to the DIN-rail (1), then push it against the DIN-rail to make it snap on (2).

To unmount the module, a screwdriver is needed. Use the screwdriver to push the DIN-rail fastening mechanism on the back of the module down until it locks in a fixed and open position (1). Then unhook the module from the DIN-rail (2).

Do not leave the module with the DIN-rail fastening mechanism in a fixed and open position. This may eventually wear the fastening mechanism out so it cannot be used efficiently. Be sure to push the DINrail fastening mechanism back into the fixed and closed position after demounting the module.

#### 3.2.2 Wall Mounting

 $(\mathbf{i})$ 

Use the wall mounting option if there is a need to place the linking device in an environment exposed to vibration. This way of mounting the module offers more stability than the traditional DIN-rail mounting.

: The device should be fastened in a standing-up position, to ensure a constant air flow.

When mounting the device to a wall using the wall mount option, do not forget to connect the module to protective earth (PE) via the power connector.

Step	Description	Visual Description
0	Open up the package containing the wall mounting accessories. - One metal frame - Industrial velcro - Four plastic vibration dampers	
2	Remove the plastic protection from one side of the velcro. Attach the velcro to the metal frame. Attach the four plastic vibration dampers to the linking device, on the side that will face the wall.	
3	Remove the plastic protection from the other side of the velcro.	
4	Turn the device around, so that the plastic vibration dampers face downwards. Fasten the metal frame to the device by pressing the frame firmly against the device, making the two velcro parts attach to each other.	
5	Attach the metal frame and the de- vice to a wall using screws and wash- ers (not enclosed).	

3.3

Name	Indication	Meaning	
(MS EN) Module Status	Off Flashing green Green Orange Flashing red Red	Power off Not configured, or scanner in idle state Controlled by a scanner in run state Boot up Recoverable error Fatal error	
(NS) Network Status	Off Flashing green Green Orange Flashing red Red	No IP address Online, no connection Online, connection established Boot up Timeout Duplicate IP address, fatal error	
(Link 1, Link 2) Ethernet Link 1 & 2	Off Flashing green Yellow Flashing yellow	No link Receiving/transmitting Ether- net packets at 100 Mbit Boot up Receiving/transmitting Ether- net packets at 10 Mbit	
(MS PB) Master Status	Off Red Flashing green Green	Master is offline Master in STOP mode Master in CLEAR mode Master in OPERATE mode	
(DB) Database Status	Off Green Flashing green Red	No database Database OK Database download in progress Database invalid	
(CS) Communication Status	Off Green Flashing green Red	No data exchange Data exchange with all slaves Data exchange with at least one slave Bus control error	
(TH) Token Hold	Off Green	Another station holds the Token Master interface holds the Token	

At power-up, LED 1 - 2 will indicate solid orange and LED 3 - 4 will indicate solid yellow for 15 - 30 seconds. This will be followed by a LED test sequence, performed on the (MS EN) Module Status and (NS) Network Status LEDs.

#### 4.2 Firmware Update

Via the firmware page, it is possible to update the firmware in the linking device. The Firmware Update Log presents information about the latest firmware update.

To update the firmware, find the firmware file (.swu) on the computer, and press install. The linking device will restart two times during the process.

OVERVIEW	Select a firmware package file (*.swu) for upload. Välj fil Ingen fil har valts Install

This section will be a guide through all steps necessary to create a basic configuration for the EtherNet/IP to PROFIBUS DP Linking Device.

## 5.1 Step by Step Guide

- 1. Start the Studio 5000 software. Expand the "I/O Configuration" folder in the tree view. Right-click "Ethernet" and select "New Module".
- 2. Select the HMS-EN2PB-R linking device and click "Create".
- 3. In the "New Module" window, assign a name to the module. The IP address should be set via the BOOTP-DHCP server and entered in the IP address field. Click "Change" in the "Module Definition" section.

aeneral	Connectio	n   Module Info	Internet Protocol	Port Configuration	Network	/endor

12. When the configuration is finished, close the bus view window. Click "Yes" to apply the new configuration and transfer it to the tag editor.

13. The tag editor is now updated with Studio 5000 tags. All transactions are visible under the "Input Data" and "Output data" tabs.

14. Download the configuration to the linking device by clicking the download icon in the tool bar. The progress bar will indicate the progress.

_	Sending configuration 5%

- 15. Close the tag editor.
- 16. Close the "Module Definition" window. Click "Yes" in the RSLogix 5000 information window, to change the module definition in the Studio 5000 environment.

RSLogix !	5000
<u> </u>	These changes will cause module data types and properties to change. Data will be set to default values unless it can be recovered from the existing module properties. Verify module properties before Applying changes.
	Change module definition?
	Yes No

17. The tags for the configuration are now imported into Studio 5000.

## 6 Tag Editor

The tag editor is supported by Windows 7 and later.

#### 6.1 Tag Editor Overview

Initially, the tag editor looks like this.

The pen symbol in the lower right corner tells if the PLC is online or offline. No configuration is possible while the PLC is online.

#### 6.1.1 Menu Choices

#### File

Import

Import a configuration from the hard drive.

Export

Export a configuration from the hard drive.

• Exit

#### Edit

- Select All
- Deselect All

#### Tools

Edit PROFIBUS Configuration

This option will launch the PROFIBUS configuration manager.

#### Download Configuration to EN2PB-R

Download the configuration to the linking device.

Launch IPConfig

With the IPConfig tool, it is possible to scan for devices and alter IP settings for the linking device.

- Reboot
- Factory Reset

Resets the linking device to default values.

Restore

Loads the latest stored configuration from Studio 5000.

- Options
  - Hide report on retrieve of PROFIBUS configuration.
  - Group tags on PLC (by PROFIBUS slave)

#### Help

About

#### 6.2 Tag Editor Basics

When the PROFIBUS configuration tool is closed after configuration, the tag editor will be filled with resulting Studio 5000 tags.

Tags that are new or altered since last time, will be presented in magenta color.

In the left most column, check boxes makes it possible to choose which tags should be exported to the Studio 5000 environment. Only tags that are checked will be exported.

## 6.3 Tag Rule Definitions

The default and automatically generated tags will follow and adhere to the rules below. This list is only informative.

When adding process tags (controller tags) to the configuration the following rules must apply:

- The designated memory address of the process tag must be inside the process data area boundaries.
- The memory address of the process tag must be divisible by four, for data types DINT or REAL or a tag whose dimension is above zero.
- The memory address of the process tag must be dividable by two for data type INT.
- Two process tags can not occupy the same memory address area on the EtherNet/IP side.
- Two process tags can address the same memory address on the PROFIBUS side.
- The designated memory address of the process tag must smaller than or equal to the corresponding designated memory address in the configuration.
