## General Description

The Supertex HV2808 is a low harmonic distortion, 32-channel, high voltage analog switch integrated circuit (IC), designed for use in medical ultrasound imaging systems as a probe selection relay replacement. It serves as a 16PDT (16-pole, double throw) high voltage analog switch array. HV2808 is a very fast transducer multiplexer that consumes minimal power and emits no audible noise.

Using HVCMOS technology, this device combines high voltage bilateral DMOS switches and low power CMOS logic to provide efficient control of high voltage analog signals.

The device is suitable for various combinations of high voltage supplies, e.g., $\mathrm{V}_{\mathrm{PP}} / \mathrm{V}_{\mathrm{NN}}:+40 \mathrm{~V} /-160 \mathrm{~V},+100 \mathrm{~V} /-100 \mathrm{~V}$, and $+160 \mathrm{~V} /-40 \mathrm{~V}$.

The HV2808 comes in an $8 \times 8 \times 1.0 \mathrm{~mm}$, 56-Lead QFN package. Compared to an electromechanical relay, it not only saves considerable PCB area, but also saves on the PCB assembled height.

## Notes:

1. Power up/down sequence is arbitrary except GND must be powered-up first and powered-down last.
2. $V_{S I G}$ must be $V_{N N} \leq V_{S I G} \leq V_{P P}$ or floating during power up/down transition.
3. Rise and fall times of power supplies $V_{D D}, V_{P P}$ and $V_{N N}$ should not be less than 1.0 msec .
