## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# 32-Channel, 256 Gray-Shade High Voltage Driver 

## Features

- HVCMOS ${ }^{\circledR}$ technology
- 5.0V CMOS inputs
- Output voltage up to +80 V
- PWM gray shade conversion
- Capable of 256 levels of gray shading
- 10MHz shift and count clock frequency
- 20 MHz data throughput rate
- 8 bit data bus
- 32 outputs per device
- BLANK function
- Output polarity control

## Applications

- Field Emission Displays (FED)
- Polymer Liquid Crystal Displays (PLCD)
- Vacuum Fluorescent Displays (VFD)

## General Description

The HV632 is a 32-channel gray-shade column driver IC designed for driving electrofluorescent displays. Using Supertex's unique HVCMOS ${ }^{\circledR}$ technology, it is capable of 256 levels of gray shading by PWM conversion.

Input data, in groups of eight, is latched into a set of data latches on both edges of the shift clock. The data shifted in the first data latch corresponds to $\mathrm{HV}_{\text {out }} 1$, the second data latch corresponds to $\mathrm{HV}_{\text {out }} 2$, and so on. These data are compared to the contents of the master binary counter which counts on both edges of the count clock. Each time the master counter begins to decrement from 1111 1111, the data in the data latches are compared with the contents of the counter; if they match, the corresponding outputs will go high. The master counter counts down to 00000001 and then starts to count up again. The outputs that are at high will stay at high until the contents of the counter match the data in the data latches again. Therefore, the higher the binary data in the data latches, the longer the outputs will stay at high. Thus, different high voltage pulse widths are produced. When the counter reaches its 11111111 count while counting up, the device is ready for the next operation cycle. A data value of 00000000 produces no pulse; the output stays low.

The BLANK input signal will reset the master counter to all ones (1111 1111) and set all high voltage outputs to low, or will set all high voltage outputs to high state, when the POL is low. The POL input signal, forced low, will invert the polarity of the output pulse. If left unconnected, POL input will be pulled high to $V_{D D}$ by an on-chip resistor.

## Typical Application Circuit

Ordering Information

-G denotes a lead ( Pb )-free / RoHS compliant package

## Absolute Maximum Ratings

| Parameter | Value |
| :--- | ---: |
| Supply voltage, $\mathrm{V}_{\mathrm{DD}}$ | -0.5 V to +7.5 V |
| Supply voltage, $\mathrm{V}_{\mathrm{PP}}$ | -0.5 V to +90 V |
| Logic input levels | -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$ |
| Continuous total power dissipation ${ }^{1}$ | 1200 mW |
| Operating temperature range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage temperature range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## Note:

1. For operation above $25^{\circ} \mathrm{C}$ ambiant derate linearly to $85^{\circ} \mathrm{C}$ at $20 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$
