Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

ML405 Evaluation Platform

User Guide

XILINX ®

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
06/23/06	1.0	Initial Xilinx release.
06/30/06	1.0.1	Release to Web.
01/31/07	1.1	Updated jumper information for 2.5V and 3.3V operation (Table 1-1, page 12).
03/21/07	1.2	Updated Table 1-19, page 31 (see table notes).
05/02/07	1.3	Added Appendix A, "Board Revisions" and information for RoHS-compliant boards.
06/28/07	1.4	Updated Table 1-19, page 31 for XAUI/SRIO support.
08/13/07	1.5	Corrected J5 pinout for HDR2_8 in Table 1-8, page 17 (U19).
03/10/08	1.5.1	Minor edits to Table A-1, page 35.

Table of Contents

Preface: About This Guide

About This Guide

The ML405 evaluation platform enables designers to investigate and experiment with features of the Virtex™-4 family of FPGAs. This user guide describes features and operation of the ML405 evaluation platform.

Guide Contents

This manual contains the following chapters:

- Chapter 1, "ML405 Evaluation Platform" provides an overview of the evaluation platform and details the components and features of the ML405 board
- Appendix A, "Board Revisions" details the differences between board revisions in the ML405 series

Additional Resources

To find additional documentation, see the Xilinx website at:

http://www.xilinx.com/literature/index.htm.

To search the Answer Database of silicon, software, and IP questions and answers, or to create a technical support WebCase, see the Xilinx website at:

http://www.xilinx.com/support.

Conventions

This document uses the following conventions. An example illustrates each convention.

Typographical

The following typographical conventions are used in this document:

Convention	Meaning or Use	Example
Courier font	Messages, prompts, and program files that the system displays	speed grade: - 100
Courier bold	Literal commands that you enter in a syntactical statement	**ngdbuild** *design_name*

Convention	Meaning or Use	Example
Helvetica bold	Commands that you select from a menu	**File → Open**
	Keyboard shortcuts	**Ctrl+C**
Italic font	Variables in a syntax statement for which you must supply values	`ngdbuild` *design_name*
	References to other manuals	See the *Development System Reference Guide* for more information.
	Emphasis in text	If a wire is drawn so that it overlaps the pin of a symbol, the two nets are *not* connected.
Square brackets [ ]	An optional entry or parameter. However, in bus specifications, such as **bus[7:0]**, they are required.	`ngdbuild` `[option_name]` `design_name`
Braces { }	A list of items from which you must choose one or more	`lowpwr =`{`on`|`off`}
Vertical bar |	Separates items in a list of choices	`lowpwr =`{`on`|`off`}

Vertical ellipsis . . .	Repetitive material that has been omitted	```IOB #1: Name = QOUT'```
		```IOB #2: Name = CLKIN'```
		```.```
		```.```
		```.```

Horizontal ellipsis . . .	Repetitive material that has been omitted	**allow block** *block_name loc1 loc2 ... locn;*

Online Document

The following conventions are used in this document:

Convention	Meaning or Use	Example
Blue text	Cross-reference link to a location in the current document	See the section "Additional Resources" for details. Refer to "Title Formats" in Chapter 1 for details.
Red text	Cross-reference link to a location in another document	See Figure 2-5 in the *Virtex-II Platform FPGA User Guide*.
Blue, underlined text	Hyperlink to a website (URL)	Go to http://www.xilinx.com for the latest speed files.

ML405 Evaluation Platform

Introduction

The ML405 evaluation platform enables designers to investigate and experiment with features of the Virtex™-4 family of FPGAs. This user guide describes features and operation of the ML405 evaluation platform.

Features

- Virtex-4 FPGA:
  - XC4VFX20-FF672
  - SFP connector for SFP module
  - SMA connectors connected to one RocketIO™ multi-gigabit transceiver (MGT)
  - Two serial ATA (SATA) host connectors
  - High-performance, low-jitter LVDS clock synthesizer for SMA/SFP MGT clocks
  - Low-jitter, 75/150-MHz LVDS clock for SATA MGTs
  - Low-jitter, LVDS clock for SGMII MGTs
    - 125 MHz for non-RoHS-compliant boards
    - 250 MHz for RoHS-compliant boards
- 128-MB DDR SDRAM, 32-bit interface running up to 400-MHz data rate
- One differential clock input pair and differential clock output pair with SMA connectors
- One 100-MHz clock oscillator (socketed) plus one extra open 3.3V clock oscillator socket
- General-purpose LEDs and pushbutton switches
- Expansion header with 32 single-ended I/Os, 16 LVDS capable differential pairs, 14 spare I/Os shared with pushbutton switches and LEDs, power, JTAG chain expansion capability, and IIC bus expansion
- Stereo AC97 audio codec with line-in, line-out, 50-mW headphone, and microphone-in (mono) jacks
- RS-232 serial port
- 16-character x 2-line LCD display
- 4-Kb IIC EEPROM
- VGA output with 330-MHz /15-bit video DAC
- PS/2 mouse and keyboard connectors

- System ACE™ CompactFlash configuration controller with Type I/II CompactFlash connector

- ZBT synchronous SRAM (9 Mb) on 32-bit data bus with four parity bits

- Intel StrataFlash (or compatible) linear flash chips (8 MB)

- 10/100/1000 tri-speed Ethernet PHY transceiver

- USB interface chip (Cypress CY7C67300) with host and peripheral ports

- Xilinx XC95144XL CPLD to allow linear flash chips to be used for FPGA configuration

- Xilinx XCF32P Platform Flash configuration storage device

- JTAG configuration port for use with Parallel Cable III, Parallel Cable IV, or Platform USB cable

- IIC fan controller

- Onboard power supplies for all necessary voltages

- 5V @ 6A AC adapter

- Power indicator LED

Package Contents

- Xilinx Virtex-4 ML405 evaluation platform

- System ACE CompactFlash card

- Power supply with power cord

- Carrying case with anti-static foam

- Xilinx serial ATA crossover cable

Additional Information

For current information about your ML405 evaluation platform, see:
http://www.xilinx.com/ml405

The information includes:

- Current version of this user guide in PDF format

- Example design files for demonstration of Virtex-4 features and technology

- Demonstration hardware and software configuration files for the System ACE controller, Platform Flash configuration storage device, CPLD, and linear flash chips

- MicroBlaze™ and PowerPC® 405 EDK reference design files

- Full schematics in PDF format and ViewDraw schematic format

- PC board layout in Pads PCB format

- Gerber files in `*.pho` and `*.pdf` for the PC board (There are many free or shareware Gerber file viewers available on the internet for viewing and printing these files)

- Additional documentation, errata, frequently asked questions, and the latest news

For information about the Virtex-4 family of FPGA devices, including product highlights, data sheets, user guides, and application notes, visit the Virtex-4 website at http://www.xilinx.com/virtex4.

Additional information is available from the data sheets and application notes from the component manufacturers.

Block Diagram

Figure 1-1 shows a block diagram of the ML405 evaluation platform (board).
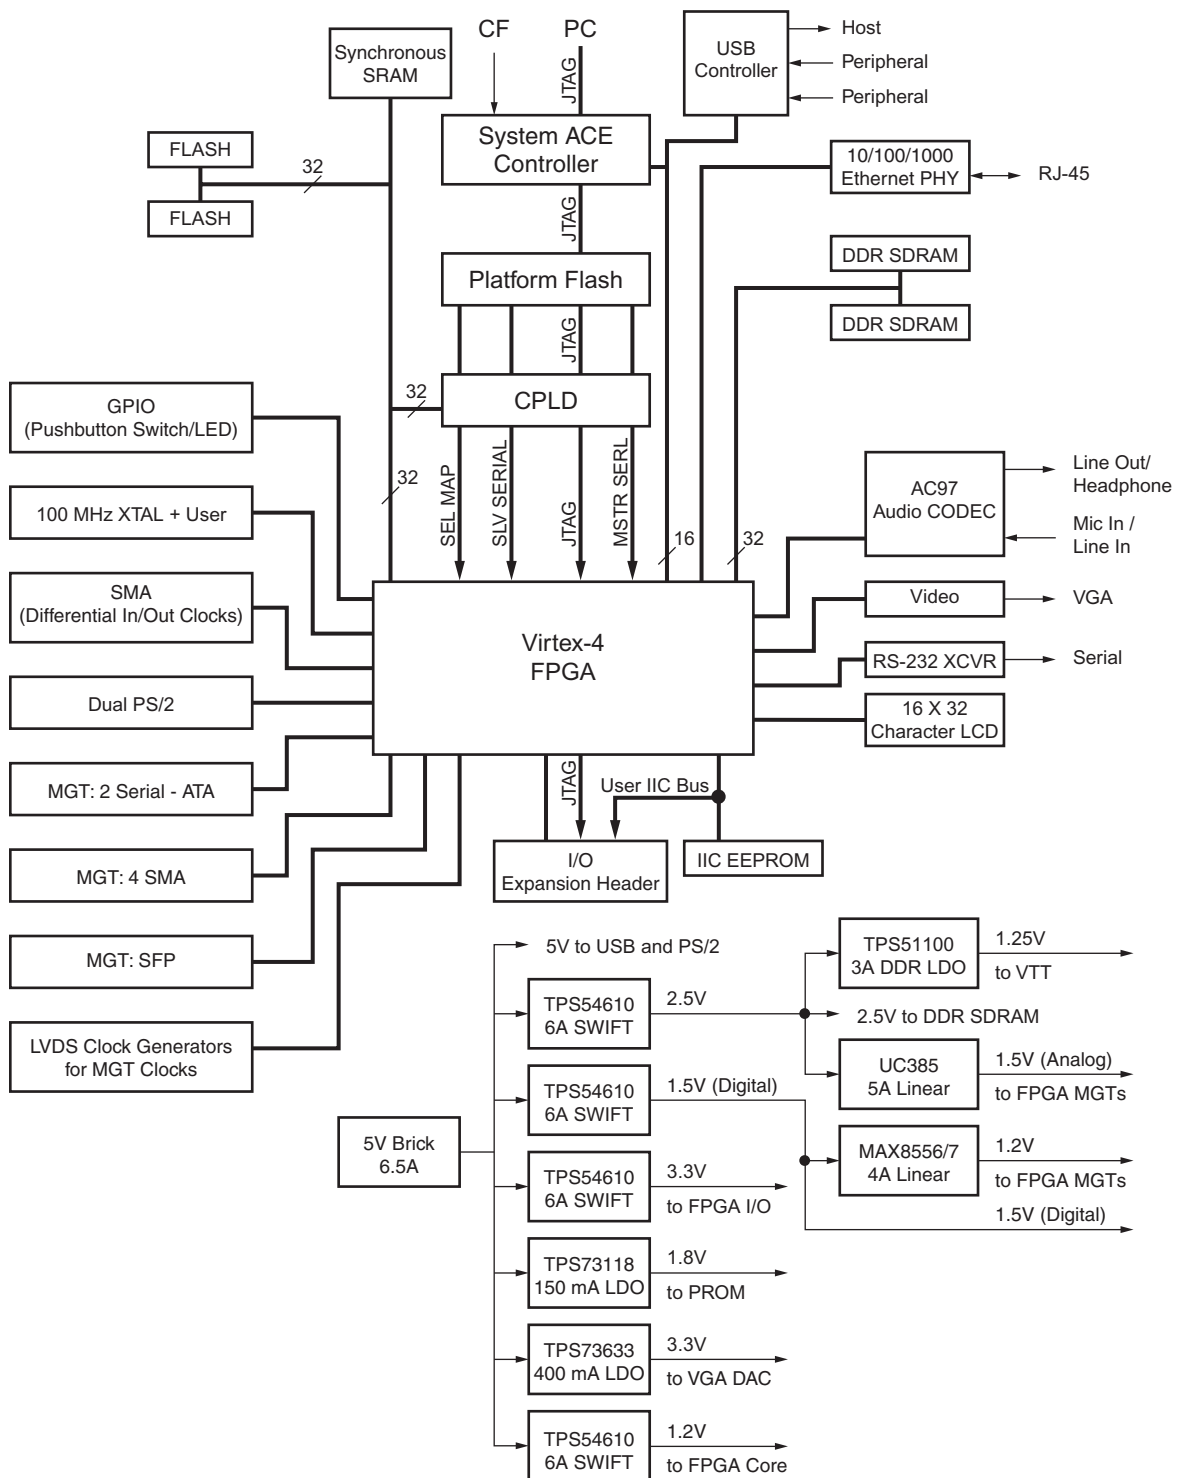

Figure 1-1:   **Virtex-4 ML405 Evaluation Platform Block Diagram**

Detailed Description

The ML405 evaluation platform (board) is shown in Figure 1-2 (front) and Figure 1-3, page 11 (back). Each feature is detailed in the corresponding numbered sections that follow.
Figure 1-2: **Detailed Description of Virtex-4 ML405 Evaluation Platform Components (Front)**
Figure 1-3: **Detailed Description of Virtex-4 ML405 Evaluation Platform Components (Back)**

> *Note:* The label on the CF card shipped with your board might differ from the one shown.

1. Virtex-4 FPGA

A Xilinx Virtex-4 FPGA, XC4VFX20-FF672-10, is installed on the evaluation platform (the board).

Configuration

The board supports configuration in all modes: JTAG, Master Serial, Slave Serial, Master SelectMAP, and Slave SelectMAP modes. See "Configuration Options," page 33 for more information.

I/O Voltage Rails

The FPGA has 9 banks. The I/O voltage applied to each bank is summarized in Table 1-1. See the *Virtex-4 Data Sheet* for more information regarding I/O standards.

Table 1-1: **I/O Voltage Rail of FPGA Banks**

FPGA Bank	I/O Voltage Rail
0	3.3V
1	3.3V
2	3.3V
3	2.5V
4	3.3V
5	2.5V
6	2.5V
7	User selectable as 2.5V or 3.3V using jumpers J15, J16, and J23.
8	3.3V

Digitally Controlled Impedance (DCI)

Some FPGA banks can support the DCI feature in Virtex-4 FPGAs. Support for DCI is summarized in Table 1-2.

Table 1-2: **DCI Capability of FPGA Bank**

FPGA Bank	DCI Capability
1	Not supported.
2	Not supported.
3	Optional: User must remove resistors R234 and R235 and must install resistors R222 and R221.[1]
4	Not supported.
5	Optional: User must install resistors R224 and R225 to use DCI. In bitgen, the switch "-g DCIUpdateMode:Quiet" must also be used.[2]
6	Not supported.
7	Optional: User must install resistors R289 and R290.[3]
8	Yes, 49.9Ω resistors are installed.

Notes:
1. Use of DCI disables the use of GPIO LED [2] and [3].
2. Use of DCI disables user control of the DDR_CS_N and DDR_CKE signals.
3. This disables the use of two I/O pins on the expansion connector J5 (pin 38 and 40).

2. DDR SDRAM

The board contains 128 MB of DDR SDRAM divided between two Infineon HYB25D512160BT-5 (or compatible) devices (U4 and U5). Each device is 16 bits wide and together form a 32-bit data bus capable of running up to 400 MHz. All DDR SDRAM signals are terminated through 47Ω resistors to a 1.25V VTT reference voltage. The board is designed for matched length traces across all DDR control and data signals except clocks and the DDR loop trace (see "DDR Clock Signal" and "DDR Loop Signal").

The board can support up to 256 MB of total DDR SDRAM memory if larger chips are installed. An extra address pin is present on the board to support up to 1-Gb DDR chips.

DDR Clock Signal

The DDR clock signal is broadcast from the FPGA as a single differential pair that drives both DDR chips. The delay on the clock trace is designed to match the delay of the other DDR control and data signals. The DDR clock is also fed back to the FPGA to allow for clock deskew using Virtex-4 DCMs. The board is designed so that the DDR clock signal reaches the FPGA clock feedback pin at the same time as it arrives at the DDR chips.

DDR Loop Signal

The DDR loop signal is a trace that is driven and then received back at the FPGA with a delay equal to the sum of the trace delays of the clock and DQS signals. This looped trace can be used in high-speed memory controllers to help compensate for the physical trace delays between the FPGA and DDR chips.

3. Differential Clock Input and Output with SMA Connectors

High-precision clock signals can be input to the FPGA using differential clock signals brought in through 50Ω SMA connectors. This allows an external function generator or other clock source to drive the differential clock inputs that directly feed the global clock input pins of the FPGA. The FPGA can be configured to present a 100Ω termination impedance.

A differential clock output from the FPGA is driven out through a second pair of SMA connectors. This allows the FPGA to drive a precision clock to an external device, such as a piece of test equipment. Table 1-3 summarizes the differential SMA clock pin connections.

Table 1-3: **Differential SMA Clock Connections**

Label	Clock Name	FPGA Pin
J10	SMA_DIFF_CLK_IN_N	B12
J7	SMA_DIFF_CLK_IN_P	A12
J8	SMA_DIFF_CLK_OUT_N	H6
J9	SMA_DIFF_CLK_OUT_P	G7

4. Oscillator Sockets

The ML405 evaluation platform has two crystal oscillator sockets, each wired for standard LVTTL-type oscillators. (A 100-MHz oscillator is pre-installed in the X1 SYSCLK socket.) These connect to the FPGA clock pins as shown in Table 1-4. The oscillator sockets accept half-sized oscillators and are powered by the 3.3V supply.

Table 1-4: **Oscillator Socket Connections**

Label	Clock Name	FPGA Pin
X1	SYSCLK	AB14
X6	USERCLK	AB12

5. LCD Brightness and Contrast Adjustment

Turning potentiometer R1 adjusts the image contrast of the character LCD.

6. DIP Switches (Not Installed)

These DIP switches are not installed on the ML405 board.

7. User and Error LEDs (Active-High)

There are 10 active-High LEDs directly controllable by the FPGA (Table 1-5 summarizes the LED definitions and connections):

- Four green LEDs are general-purpose LEDs arranged in a row

- Five green LEDs are positioned next to the north-east-south-west-center oriented pushbutton switches (only the *center* one is cited in Figure 1-2, page 10)

- One red LED is intended to be used for signaling error conditions, such as bus errors, but can also be used for any other purpose. On the ML405 board, the Error 2 LED is not accessible by the FPGA

Table 1-5: **User and Error LED Connections**

Reference Designator	Label/Definition	Color	FPGA Pin
DS14	LED North	Green	G4
DS11	LED East	Green	L7
DS3	LED South	Green	L9
DS13	LED West	Green	G12
DS12	LED Center	Green	E6
DS15	GPIOLEDS 0	Green	A10
DS4	GPIOLEDS 1	Green	B10
DS5	GPIOLEDS 2	Green	F13
DS6	GPIOLEDS 3	Green	F14
DS205	Error 1	Red	L4

8. User Pushbutton Switches (Active-High)

There are five active-High user pushbutton switches available for general-purpose usage and arranged in a north-east-south-west-center orientation (only the *center* one is cited in Figure 1-2, page 10). Table 1-6 summarizes the user pushbutton switch connections.

Table 1-6: **User Pushbutton Switch Connections**

Reference Designator	Label/Definition	FPGA Pin
SW3	GPIO_SW_N	G11
SW5	GPIO_SW_E	M6
SW4	GPIO_SW_S	L10
SW7	GPIO_SW_W	K8
SW6	GPIO_SW_C	D6

9. CPU Reset Pushbutton Switch (Active-Low)

The CPU reset pushbutton switch is active-Low and is used as a system or user reset button. This pushbutton switch is wired only to an FPGA I/O pin so it can also be used as a general-purpose pushbutton switch (Table 1-7).

Table 1-7: **CPU Reset Pushbutton Switch Connections**

Reference Designator	Label/Definition	FPGA Pin
SW10	CPU Reset	M5

10. Expansion Headers

The board contains expansion headers (U3, U4, U5, and U6) for easy expansion or adaptation of the board for other applications. The expansion connectors use standard 0.1-inch headers. The expansion connectors contain connections to single-ended and differential FPGA I/Os, ground, 2.5V/3.3V/5V power, JTAG chain, and the IIC bus. All signals on connectors U5 and U6 have matched length traces that are matched to each other.

Differential Expansion I/O Connectors

Header J5 contains 16 pairs of differential signal connections to the FPGA I/Os. This permits the signals on this connector to carry high-speed differential signals, such as LVDS data. All differential signals are routed with 100Ω differential trace impedance. Matched length traces are used across all differential signals on U5. Consequently, these signals connect to the FPGA I/O and they can be used as independent single-ended nets. The V_{CCIO} of these signals can be set to 2.5V or 3.3V by setting jumpers J15, J16, and J23. Table 1-8 summarizes the differential connections on this expansion I/O connector.

Table 1-8: **Expansion I/O Differential Connections (J5)**

J5 Differential Pin Pair		Schematic Net Name		FPGA Pin	
Pos	**Neg**	**Pos**	**Neg**	**Pos**	**Neg**
4	2	HDR2_4	HDR2_2	Y22	AA22
8	6	HDR2_28	HDR2_26	AC19	AC18

Single-Ended Expansion I/O Connectors

Header J6 contains 32 single-ended signal connections to the FPGA I/Os. This permits the signals on this connector to carry high-speed single-ended data. All single-ended signals on connector J6 are matched length traces. The V_{CCIO} of these signals can be set to 2.5V or 3.3V by setting jumpers J15, J16, and J23. Table 1-9 summarizes the single-ended connections on this expansion I/O connector.

Table 1-9: **Expansion I/O Single-Ended Connections (J6)**

62	HDR1_62	AB15
64	HDR1_64	AA15

Other Expansion I/O Connectors

In addition to the high-speed I/O paths, additional I/O signals and power connections are available to support expansion cards plugged into the ML405 board. The 14 I/O pins from the general-purpose pushbutton switches and LEDs on the board are connected to expansion connector J3. This permits additional I/Os to connect to the expansion connector if the pushbutton switches and LEDs are not used. The connection also allows the expansion card to utilize the pushbutton switches and LEDs on the board.

The expansion connector also allows the board's JTAG chain to be extended onto the expansion card by setting jumper J26 accordingly.

The IIC bus on the board is also extended onto the expansion connector to allow additional IIC devices to be bused together. If the expansion IIC bus is to be utilized, the user must have the IIC pull-up resistors present on the expansion card. Bidirectional level shifting transistors allow the expansion card to utilize 2.5V to 5V signaling on the IIC bus.

Power supply connections to the expansion connectors provide ground, 2.5V, 3.3V, and 5V power pins. If the expansion card draws significant power from the ML405 board, ensure that the total power draw can be supplied by the board.

The ML405 expansion connector is backward compatible with the expansion connectors on the ML32X and ML42X boards, thereby allowing their daughter cards to be used with the ML405 evaluation platform. Table 1-10, page 20 summarizes the additional expansion I/O connections.

Table 1-10: **Additional Expansion I/O Connections (J3)**

J3 Pin	Label	FPGA Pin	Description
1	VCC5	–	5V Power Supply
2	VCC5	–	5V Power Supply
3	VCC5	–	5V Power Supply
4	VCC5	–	5V Power Supply
5	NC	–	Not Connected
6	VCC3V3	–	3.3V Power Supply
7	VCC3V3	–	3.3V Power Supply
8	VCC3V3	–	3.3V Power Supply
9	VCC3V3	–	3.3V Power Supply
10	NC	–	Not Connected
11	TMS	–	Expansion TMS
12	TCK	–	Expansion TCK
13	TDO	–	Expansion TDO
14	TDI	–	Expansion TDI
15	DS14	E2	LED North
16	SW3 (GPIO_SW_N)	E7	GPIO Switch North
17	DS12	C6	LED Center
18	SW6 (GPIO_SW_C)	B6	GPIO Switch Center
19	DS13	F9	LED West
20	SW7 (GPIO_SW_W)	E9	GPIO Switch West
21	DS3	A5	LED South
22	SW4 (GPIO_SW_S)	A6	GPIO Switch South
23	DS11	E10	LED East
24	SW5 (GPIO_SW_E)	F10	GPIO Switch East
25	GPIOLED 0	G5	GPIO LED 0
26	GPIOLED 1	G6	GPIO LED 1
27	GPIOLED 2	A11	GPIO LED 2
28	GPIOLED 3	A12	GPIO LED 3
29	NC	–	Not Connected
30	NC	–	Not Connected
31	EXP_IIC_SCL	A17	Expansion IIC SCL
32	EXP_IIC_SDA	B17	Expansion IIC SDA

11. Stereo AC97 Audio Codec

The ML405 evaluation platform has an AC97 audio codec (U14) to permit audio processing. The National Semiconductor LM4550 Audio Codec supports stereo 16-bit audio with up to 48-kHz sampling. The sampling rate for record and playback can be different.

Note: The reset for the AC97 codec is shared with the reset signal for the flash memory chips and is asserted at power-on or upon system reset.

Separate audio jacks are provided for Microphone, Line In, Line Out, and Headphone. All jacks are stereo except for Microphone. The Headphone jack is driven by the audio codec's internal 50-mW amplifier. Table 1-11 summarizes the audio jacks.

Table 1-11:   **ML405 Audio Jacks**

Reference Designator	Description	
	Function	**Stereo/Mono**
J11	Microphone - In	Mono
J12	Analog Line - In	Stereo
J13	Analog Line - Out	Stereo
J14	Headphone - Out	Stereo

12. RS-232 Serial Port

The ML405 board contains one male DB-9 RS-232 serial port, allowing the FPGA to communicate serial data with another device. The serial port is wired as a host (DCE) device. Therefore, a null modem cable is normally required to connect the board to the serial port on a PC. The serial port is designed to operate up to 115200 Bd. An interface chip is used to shift the voltage level between FPGA and RS-232 signals.

Note: The FPGA is connected only to the TX and RX data pins on the serial port. Therefore, other RS-232 signals, including hardware flow-control signals, are not used. Flow control should be disabled when communicating with a PC.

A secondary serial interface is available by using header J27 to support debug of the USB controller chip. Header J27 brings out RS-232 voltage level signals for ground, TX data, and RX data.

13. 16-Character x 2-Line LCD

The ML405 board has a 16-character x 2-line LCD (Lumex LCM-S01602DTR/M) on the board to display text information. Potentiometer R1 adjusts the contrast of the LCD. The data interface to the LCD is connected to the FPGA to support 4-bit mode only. A level translator chip is used to shift the voltage level between the FPGA and the LCD.

Note: Care should be taken not to scratch or damage the surface of the LCD window.

14. IIC Bus with 4 Kb EEPROM

An IIC EEPROM (Microchip Technology 24LC04B-I/ST) is provided on the ML405 board to store non-volatile data such as an Ethernet MAC address. The EEPROM write protect is disabled on the ML405 board. The IIC bus uses 2.5V signaling and can operate at up to 400 kHz. IIC bus pull-up resistors are provided on the board.

The IIC bus is extended to the expansion connector so that the user can add additional IIC devices and share the IIC controller in the FPGA. If the expansion IIC bus is used, the user must have additional IIC pull-up resistors present on the expansion card. Bidirectional level shifting transistors allow the expansion card to use 2.5V to 5V signaling on the IIC bus.

A dual 1-of-4 FET multiplexer/demultiplexer chip (U60) allows the FPGA to independently access multiple IIC buses without concern for IIC device address overlap. See Table 1-12 for summary of IIC Mux options.

Table 1-12: **IIC Mux Options**

IIC Bus Connection	IIC_SEL_1	IIC_SEL_0
IIC EEPROM and expansion connector[1]	0	0
SFP Module	0	1
VGA Connector (to read monitor configuration parameters, for example: plug-and-play support)	1	0
USB Controller's IIC EEPROM	1	1

Notes:

1. Pull-down resistors default the IIC Mux to this connection

15. VGA Output

A VGA output port (P2) is present on the board to support an external video monitor. On ML405, the VGA circuitry utilizes a 330-MHz, 15-bit color video DAC (Analog Devices ADV7125JST330). The FPGA can drive only five bits of data per color (red, green, and blue).

The VGA connector supports the IIC protocol to allow the board to read the monitor's configuration parameters (for example, plug and play support. See "14. IIC Bus with 4 Kb EEPROM" for more information.

16. PS/2 Mouse and Keyboard Ports

The ML405 evaluation platform contains two PS/2 ports: one for a mouse (J17) and the other for a keyboard (J18). Bidirectional level shifting transistors allow the FPGA's 2.5V I/O to interface with the 5V I/O of the PS/2 ports. The PS/2 ports on the board are powered directly by the main 5V power jack; this jack also powers the rest of the board.

Caution! The power load of any attached PS/2 device must not overload the AC adapter.

17. System ACE Controller

The Xilinx System ACE CF configuration controller allows a Type I or Type II CompactFlash card to program the FPGA through the JTAG port. Both hardware and software data can be downloaded through the JTAG port. The System ACE controller can support up to eight configuration images on a single CompactFlash card. The configuration address pushbutton switches allow the user to choose which of the eight configuration images to use.

System ACE error and status LEDs indicate the operational state of the System ACE controller:

- A blinking red error LED indicates that no CompactFlash card is present
- A solid red error LED indicates an error condition during configuration
- A blinking green status LED indicates a configuration operation is ongoing
- A solid green status LED indicates a successful download

Every time a CompactFlash card is inserted into the System ACE socket, a configuration operation is initiated. Pressing the System ACE reset pushbutton switch reprograms the FPGA.

The board also features a System ACE *failsafe* mode. In this mode, if the System ACE controller detects a failed configuration attempt, it automatically reboots back to a predefined configuration image. The failsafe mode is enabled by inserting two jumpers across J29 and J30 (in horizontal or vertical orientation).

> *Caution!* Insert or remove the CompactFlash card only when the board power is off. Use caution when inserting a CompactFlash card with exposed metallic surfaces. Inserting the card incorrectly can cause a short with the traces or components on the board.

The System ACE MPU port is connected to the FPGA. This allows the FPGA to control the System ACE chip and use it to reconfigure the system or access the CompactFlash card as a generic FAT file system. The data bus for the System ACE MPU port is shared with the USB controller.

For configuration through the System ACE controller, the configuration selector switch (SW12) must be set to the SYS ACE position.

18. ZBT Synchronous SRAM

The ZBT synchronous SRAM (Cypress CY7C1354B or compatible) provides high-speed, low-latency external memory to the FPGA. The memory is organized as 256K x 36 bits. This provides for a 32-bit data bus with support for four parity bits.

The SRAM and FLASH memory share the same data bus. The parity bits are not available on the ML405 board.

19. Linear Flash

Two 32-Mb linear flash devices (Micron MT28F320J3RG-11 ET) are installed on the board for a total of 8 MB of flash memory. These flash memory devices are Intel StrataFlash compatible. This memory provides non-volatile storage of data, software, or bitstreams. Each flash device is 16 bits wide and together forms a 32-bit data bus that is shared with SRAM. Each flash device is 16 bits wide, and the two devices together form a 32-bit data bus that is shared with SRAM.In conjunction with a CPLD, the flash memory can also be used to program the FPGA.

Note: The reset for the AC97 Codec is shared with the reset signal for the flash memory chips and is designed to be asserted at power-on or upon system reset.

20. Xilinx XC95144XL CPLD

A Xilinx XC95144XL CPLD is connected to the flash memory and the FPGA configuration signals. This supports applications where flash memory programs the FPGA. The CPLD is programmed from the main JTAG chain of the board. The CPLD is wired so that it can support master or slave configuration in serial or parallel (SelectMAP) modes. For FPGA configuration via the CPLD and flash, the configuration selector switch (SW12) must be set to the CPLD Flash position. See the section for more information.

21. 10/100/1000 Tri-Speed Ethernet PHY

The ML405 evaluation platform contains a Marvell Alaska PHY device (88E1111) operating at 10/100/1000 Mb/s (Table 1-13). The board supports MII, GMII, RGMII, and SGMII interface modes with the FPGA. The PHY is connected to a Halo HFJ11-1G01E RJ-45 (or compatible) connector with built-in magnetics. A 25-MHz crystal supplies the clock signal to the PHY. The PHY is configured to default at power-on or reset to the settings shown in Table 1-19, page 31. These settings can be overwritten via software, except PHYADR[4:0].

Table 1-13: **Board Connections for PHY Configuration Pins**

Config Pin	Connection on Board	Bit[2] Definition and Value	Bit[1] Definition and Value	Bit[0] Definition and Value
CONFIG0	VCC 2.5V	PHYADR[2] = 1	PHYADR[1] = 1	PHYADR[0] = 1
CONFIG1	Ground	ENA_PAUSE = 0	PHYADR[4] = 0	PHYADR[3] = 0
CONFIG2	VCC 2.5V	ANEG[3] = 1	ANEG[2] = 1	ANEG[1] = 1
CONFIG3	VCC 2.5V	ANEG[0] = 1	ENA_XC = 1	DIS_125 = 1
CONFIG4	VCC 2.5V	HWCFG_MODE[2] = 1	HWCFG_MODE[1] = 1	HWCFG_MODE[0] = 1
CONFIG5	VCC 2.5V	DIS_FC = 1	DIS_SLEEP = 1	HWCFG_MODE[3] = 1
CONFIG6	LED_RX	SEL_BDT = 0	INT_POL = 1	75/50Ω = 0

Jumpers J48, J49, and J57 allow the user to select the default interface that the PHY uses (Table 1-14). The interface can also be changed via MDIO commands.

Table 1-14: **PHY Default Interface Mode**

Mode	Jumper Settings		
	J48	J49	J57
GMII/MII to copper (default)	Jumper over pins 1-2	Jumper over pins 1-2	No jumper
SGMII to copper, no clock	Jumper over pins 2-3	Jumper over pins 2-3	No jumper
RGMII	Jumper over pins 1-2	No jumper	Jumper on
