

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Model Number	Input Range (Vdc)		Vout (Vdc)	Iout (A)
	Min	Max		
ICF0184V1xC	9	36	12	84
ICF0442V1xC	9	36	24	42
ICF0536V1xC	9	36	28	36
ICF0621V1xC	9	36	48	21
ICF0719V1xC	9	36	53	19

### Features

- 4:1 Input voltage range of 9-36V
- Single outputs of 12V, 24V, 28V, 48V or 53V
- 2250Vdc Isolation voltage (Input-to-Output)
- Industry Standard full brick package 4.7" x 2.5" x 0.52" (119mm x 64mm x 13.2mm)
- Efficiency up to 96%
- Excellent thermal performance
- Over-Current and Short Circuit Protection
- Over-Temperature protection
- Monotonic startup into pre-bias loads
- 400kHz Fixed switching frequency
- Remote On/Off control (Positive or Negative logic)
- External Trim adjust and Remote Sense functions
- Operating Temp. Range -40°C to +105°C
- RoHS Compliant

### Product Overview

The 4:1 input voltage 1000 Watt single output ICF DC-DC converter provides a precisely regulated dc output. The output voltage is fully isolated from the input, allowing the output to be positive or negative polarity and with various ground connections. The enclosed full brick package meets the most rigorous performance standards in an industry standard footprint for process control (24Vin), and Commercial-Off-The-Shelf (28Vin) applications.

The ICF Series includes an external TRIM adjust, Remote Sense and remote ON/OFF control. Threaded through holes are provided to allow easy mounting or the addition of a heat sink

for extended temperature operation.

The converter's high efficiency and high power density are accomplished through use of high-efficiency synchronous rectification technology, advanced electronic circuit, packaging and thermal design thus resulting in a high reliability product. The converter operates at a fixed frequency of 400kHz and follows conservative component derating guidelines.

Product is designed and manufactured in the USA.

### Part Number Structure and Ordering Guide

Description	Part Number Structure										Definition and Options
Product Family	I	C									IC= Industrial Class
Form Factor			F								F = Full Brick
Vout*				0	4						01 = 12Vout, 04 = 24Vout, 05 = 28Vout, 06 = 48Vout, 07 = 53Vout
Output Current						4	2				Max Iout in Amps
Vin Range								V	1		V1 = 9 to 36V
On/Off Control Logic									P		N = Negative, P = Positive (Standard)
Specific Customer Configuration									X	X	Customer Code, Omit for Standard
RoHS Compliant											C RoHS 6/6 Compliant

\*NOTE: Some part number combinations might not be available. Please contact the factory for non-standard or special order products.

### Electrical Specifications – All Models

Conditions:  $T_A = 25\text{ }^\circ\text{C}$ , Airflow = 300 LFM (1.5 m/s),  $V_{in} = 24\text{VDC}$ , unless otherwise specified. Specifications are subject to change without notice.

Parameter	Notes	Min	Typ	Max	Units
<b>Absolute Maximum Ratings</b>					
Input Voltage	Continuous	0		40	V
	Transient (100ms)			50	V
Operating Temperature (See Note 1)	Baseplate (100% load) Standard model	-40		105	$^\circ\text{C}$
Storage Temperature		-55		125	$^\circ\text{C}$
<b>Isolation Characteristics and Safety</b>					
Isolation Voltage	Input to Output	2250			Vdc
	Input to Baseplate & Output to Baseplate	1500			Vdc
Isolation Capacitance			9000		pF
Isolation Resistance		10	20		M $\Omega$
Insulation Safety Rating			Basic		
Agency Approvals	Designed to meet UL/cUL 60950, IEC/EN60950-1				
<b>Feature Characteristics</b>					
Fixed Switching Frequency			200		kHz
	Input Current and Output Voltage Ripple		400		kHz
Output Voltage Trim Range	Adjustable via TRIM (Pin 12)	60		110	%
Remote Sense Compensation	Between each SENSE input and its corresponding OUT pin			1	V
Output Overvoltage Protection	Non-latching	114	122	130	%
Overtemperature Shutdown (Baseplate)	Non-latching ( $V_{in}=9\text{V}; 12\text{V}, 24/36\text{V}$ )	108	112	115	$^\circ\text{C}$
Auto-Restart Period	Applies to all protection features	1.7	2	2.3	s
Turn-On Time from $V_{in}$	Time from UVLO to $V_o=90\%V_{OUT(NOM)}$ Resistive load	480	517	530	ms
Turn-On Time from ON/OFF Control Time from ON to $V_o=90\%V_{OUT(NOM)}$ Resistive load	ICF0442V1 and ICF0536V1	20	27	35	ms
	ICF0621V1 and ICF0719V1	20	35	50	ms
Rise Time $V_{out}$ from 10% to 90%	ICF0442V1 and ICF0536V1	4	7	11	ms
	ICF0621V1 and ICF0719V1	7	15	25	ms
<b>ON/OFF Control – Positive Logic</b>					
ON state	Pin open = ON or	2		12	V
Control Current	Leakage current			0.16	mA
OFF state		0		0.8	V
Control current	Sinking	0.3		0.36	mA
<b>ON/OFF Control – Negative Logic</b>					
ON state	Pin shorted to – ON/OFF pin or	0		0.8	V
OFF state	Pin open = OFF or	2		12	V
<b>Thermal Characteristics</b>					
Thermal resistance Baseplate to Ambient	Converter soldered to 5" x 3.5" x 0.07", 4 layer/20z copper FR4 PCB.		3.3		$^\circ\text{C/W}$

1. A thermal management device, such as a heatsink, is required to ensure proper operation of this device. The thermal management medium is required to maintain baseplate  $< 105^\circ\text{C}$  for full rated power.

### Electrical Specifications - ICF0184V1xG

Conditions:  $T_A = 25\text{ }^\circ\text{C}$ , Airflow = 300 LFM (1.5 m/s) and 0.9" heatsink,  $V_{in} = 14\text{VDC}$ , unless otherwise specified. Specifications are subject to change without notice.

### TECHNICAL NOTES

#### Input Fusing

The ICF converters do not provide internal fusing and therefore in some applications external input fuse may be required. Use of external fuse is also recommended if there is possibility for input voltage reversal. For greatest safety, it is recommended to use fast blow fuse in the ungrounded input supply line.

#### Input Reverse Polarity Protection

The ICF converters do not have input reverse polarity. If input voltage polarity is reversed, internal diodes will become forward biased and draw excessive current from the power source. If the power source is not current limited or input fuse not used, the converter could be permanently damaged.

#### Input Undervoltage Protection

Input undervoltage lockout is standard with this converter. The ICF converter will start and regulate properly if the ramping-up input voltage exceeds Turn-on threshold of typ. 8.5V (See Specification) and remains at or above Turn-on Threshold.

The converter will turn off when the input voltage drops below the Turn-off Threshold of typical 8V (See specification) and converter enters hiccup mode and will stay off for 2 seconds. The converter will restart after 2 seconds only if the input voltage is again above the Turn-on Threshold.

The built-on hysteresis and 2 second hiccup time prevents any unstable on/off operation at the low input voltage near Turn-on Threshold.

User should take into account for IR and inductive voltage drop in the input source and input power lines and make sure that the input voltage to the converter is always above the Turn-off Threshold voltage under ALL OPERATING CONDITIONS.

#### Start-Up Time

The start-up time is specified under two different scenarios: a) Startup by ON/OFF remote control (with the input voltage above the Turn-on Threshold voltage) and b) Start-up by applying the input voltage (with the converter enabled via ON/OFF remote control).

The startup times are measured with maximum resistive load as: a) the interval between the point when the ramping input voltage crosses the Turn-on Threshold and the output voltage reaches 90% of its nominal value and b) the interval between the point when the converter is enabled by ON/OFF remote control and time when the output voltage reaches 90% of its nominal value.

When converter is started by applying the input voltage with ON/OFF pin active there is delay of 500msec that was intentionally provided to prevent potential startup issues especially at low input voltages

#### Input Source Impedance

Because of the switching nature and negative input impedance of DC-DC converters, the input of these converters must be driven from the source with both low AC impedance and DC input regulation.

The ICF converters are designed to operate without external components as long as the source voltage has very low impedance and reasonable voltage regulation. However, since this is not the case in most applications an additional input capacitor is required to provide proper operations of the ICF converter. Specified values for input capacitor are recommendation and need to be adjusted for particular application. Due to large variation between applications some experimentation may be needed.

In many applications, the inductance associated with the distribution from the power source to the input of the converter can affect the stability and in some cases, if excessive, even inhibit operation of the converter. This becomes of great consideration for input voltage at 12V or below.

The DC input regulation, associated with resistance between input power source and input of the converter, plays significant role in particular in low input voltage applications such as 12V battery systems.

Note that input voltage at the input pins of the connector must never degrade below Turn-off threshold under all load operating conditions.

Note that in applications with high pulsating loads additional input as well as output capacitors may be needed. In addition, for EMI conducted measurement, due to low input voltage it is recommended to use 5 $\mu$ H LISNs instead of typical 50 $\mu$ H LISNs.

#### Input/Output Filtering

##### Input Capacitor

Minimum required input capacitance, mounted close to the input pins of the converter, is 1000 $\mu$ F with ESR < 0.1 $\Omega$ .

Several criteria need to be met when choosing input capacitor: a) type of capacitor, b) capacitance to provide additional energy storage, c) RMS current rating, d) ESR value that will ensure that output impedance of the input filter is lower than input impedance of the converter and its variation over the temperature.

Since inductance of the input power cables could have significant voltage drop due to rate of change of input current  $d(i_{in})/dt$  during transient load operation, an external capacitor on the output of the converter is required to reduce  $d(i_{in})/dt$ . Another constraint is minimum rms current rating of the input capacitors which is application dependent. One component of input rms current handled by input capacitor is high frequency component at switching frequency of the converter (typ. 400kHz) and is specified under "Input terminal ripple current"  $i_c$ . Typical values at full rated load and 24 Vin are provided in Section "Characteristic Waveforms" for each model and are in range of 2.5A (28Vout) – 3.6A (24Vout). It is recommended to use ceramic capacitors for attenuating this component for input terminal ripple current, which

is also required to meet requirement for conducted EMI (See EMI Section). The second component of the input ripple current is due to pulsating load current being reflected to the input and electrolytic capacitors usually used for this purpose need to be selected accordingly. Using several electrolytic capacitors in parallel on the input is recommended.

ESR of the electrolytic capacitors, need to be carefully chosen taken into account temperature dependence.

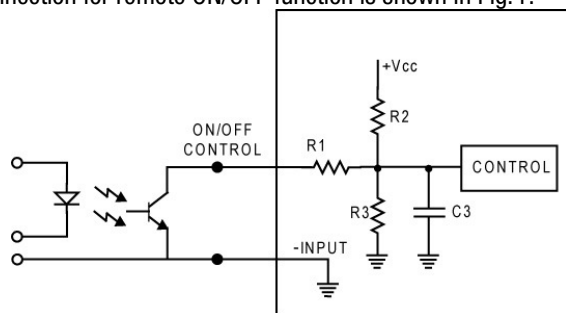

**Output Capacitor**

Similar considerations apply for selecting external output capacitor. For additional high frequency noise attenuation use of ceramic capacitors is recommended while in order to provide stability of the converter during high pulsating load high value electrolytic capacitor is required. It is recommended to use several electrolytic capacitors in parallel in order to reduce effective ESR. Note that external output capacitor also reduces slew rate of the input current during pulsating load transients as discussed above.

We recommend 2 x 470uF (<40mΩ total ESR) or 3 x 330uF as minimum external output capacitance.

**ON/OFF (Pins 1 and 2)**

The ON/OFF pin is used to turn the power converter on or off remotely via a system signal and has positive logic. A typical connection for remote ON/OFF function is shown in Fig. 1.

**Fig. 1: Circuit configuration for ON/OFF function.**

The positive logic version turns on when the ON/OFF pin is at logic high and turns off when at logic low. The converter is on when the ON/OFF pin is either left open or external voltage greater than 2V and not more than 12V is applied between ON/OFF pin and -INPUT pin. See the Electrical Specifications for logic high/low definitions.

The negative logic version turns on when the ON/OFF pin is at logic low and turns off when at logic high. The converter is on when the ON/OFF pin is either shorted to -INPUT pin or kept below 0.8V. The converter is off when the ON/OFF pin is either left open or external voltage not more than 12V is applied between ON/OFF pin and -INPUT pin. See the Electrical Specifications for logic high/low definitions.

The ON/OFF pin is internally pulled up to typically 4.5V via resistor and connected to internal logic circuit via RC circuit in order to filter out noise that may occur on the ON/OFF pin. A properly de-bounced mechanical switch, open-collector transistor, or FET can be used to drive the input of the ON/OFF pin. The device must be

**Wide Input 1000 Watt Isolated Full Brick DC-DC**

capable of sinking up to 0.36mA at a low level voltage of 0.8 V. During logic high, the typical maximum voltage at ON/OFF pin (generated by the converter) is 4.5V, and the maximum allowable leakage current is 160µA. If not using the remote on/off feature leave the ON/OFF pin open.

TTL Logic Level - The range between 0.81V and 2V is considered the dead-band. Operation in the dead-band is not recommended.

External voltage for ON/OFF control should not be applied when there is no input power voltage applied to the converter.

**Output Overcurrent Protection (OCP)**

The converter is protected against overcurrent or short circuit conditions. Upon sensing an overcurrent condition, the converter will switch to constant current operation and thereby begin to reduce output voltage. When the output voltage drops below approx. 50% of the nominal value of output voltage, the converter will shut down.

Once the converter has shut down, it will attempt to restart nominally every 2 seconds. The attempted restart will continue indefinitely until the overload or short circuit conditions are removed or the output voltage rises above 50% of its nominal value.

Once the output current is brought back into its specified range, the converter automatically exits the hiccup mode and continues normal operation.

During initial startup if output voltage does not exceed typical 50% of nominal output voltage within 500 msec after the converter is enabled, the converter will be shut down and will attempt to restart after 2 seconds.

In case of startup into short circuit, internal logic detects short circuit condition and shuts down converter typical 5 msec after condition is detected. The converter will attempt to restart after 2 seconds until short circuit condition exists.

**Output Overvoltage Protection (OVP)**

The converter will shut down if the output voltage across +OUT (Pins 5 and 6) and -OUT (Pins 8 and 9) exceeds the threshold of the OVP circuitry. The OVP circuitry contains its own reference, independent of the output voltage regulation loop. Once the converter has shut down, it will attempt to restart every 2 seconds until the OVP condition is removed.

Note that OVP threshold is set for nominal output voltage and not trimmed output voltage value or remote sense voltage.

**Overtemperature Protection (OTP)**

The ICF converters have non-latching overtemperature protection. It will shut down and disable the output if temperature at the center of the base plate exceeds a threshold of typical 108°C for 9Vin, 112°C for 12Vin and 115°C for 24Vin/36Vin. Measured with ICF converter soldered to 5" x 3.5" x 0.07" 4 layers/ 2 Oz Cooper FR4 PCB. The converter will automatically restart when the base temperature has decreased by approximately 20°C.

**Safety Requirements**

Basic Insulation is provided between input and the output. The converters have no internal fuse. To comply with safety agencies requirements, a fast-acting or time-delay fuse is to be provided in the unearthed lead. Recommended fuse values are:

- a) 140A for 9V<Vin<18V
- b) 90A for 18V<Vin<36V.

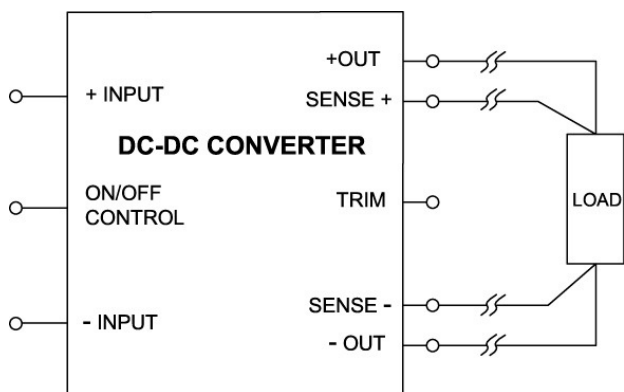

**Electromagnetic Compatibility (EMC)**

EMC requirements must be met at the end-product system level, as no specific standards dedicated to EMC characteristics of board mounted component dc-dc converters exist.

With the addition of a two stage external filter, the ICF converters will pass the requirements of MILSTD-461F CE102 Base Curve for conducted emissions. Note that 5uH LISN should be used in order to enable operation of the converter at low input voltage.

**Remote SensePins (Pins 10 and 11)**

Sense inputs compensate for output voltage inaccuracy delivered at the load.

**Fig. 2: Circuit configuration for Remote sense function.**

The sense input and power Vout pins are internally connected through 100Ω (SENSE+ to +OUT) and 10 Ω (SENSE- to –OUT) resistors enabling the converter to operate without external connection to the Sense. If the Sense function is not used for remote regulation, the user should connect SENSE- (Pin 10) to – OUT (Pins 8 and 9) and SENSE+ (Pin 11) to +OUT (Pins 5 and 6) at the converter pins.

Sense lines must be treated with care in PCB layouts and should run adjacent to DC signals. If cables and discrete wiring is used, it is recommended to use twisted pair, shielded tubing or similar techniques.

The maximum voltage difference between Sense inputs and corresponding power pins should be kept below 1V, i.e.:

$$V(\text{SENSE+}) - V(+\text{OUT}) \leq 1V$$

$$V(-\text{OUT}) - V(\text{SENSE-}) \leq 1V$$

Note that maximum output power is determined by maximum output current and highest output voltage at the output pins of the converter:

$$[V(+\text{OUT}) - V(-\text{OUT})] \times I_{\text{out}} \leq P_{\text{out rated}}$$

**Output Voltage Adjust/TRIM (Pin 12)**

The TRIM (Pin 12) allows user to adjust output voltage 10% up or -40% down relative to rated nominal voltage by addition of external trim resistor. Trim resistor should be mounted close to the converter and connected with short leads. Internal resistor in the converter used for the TRIM is high precision 0.1% with temperature coefficient 25 ppm/ °C. The accuracy of the TRIM is therefore determined by tolerance of external Trim resistor. If trimming is not used, the TRIM pin should be left open.

**Trim Down – Decrease Output Voltage**

Trimming down is accomplished by connecting an external resistor,  $R_{\text{trim-down}}$ , between the TRIM (pin 12) and the SENSE- (pin 10), with a value of:

$$R_{\text{trim-down}} = \left( \frac{499}{\Delta} - 9.98 \right) \text{ [k}\Omega\text{]}$$

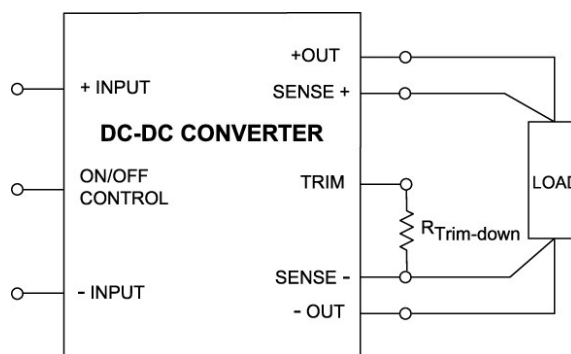

Where,

$R_{\text{trim-down}}$  = Required value of the trim-down resistor [kΩ]

$V_{0(\text{NOM})}$  = Nominal value of output voltage [V]

$V_{0(\text{REQ})}$  = Required value of output voltage [V]

$$\Delta = \left| \frac{V_{0(\text{REQ})} - V_{0(\text{NOM})}}{V_{0(\text{NOM})}} \right| \text{ [%]}$$

**Fig. 3: Circuit configuration for Trim-down function**

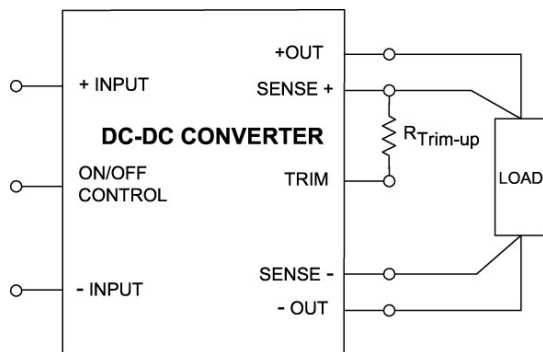

To trim the output voltage 10% ( $\Delta=10$ ) down, required external trim resistance is:

$$R_{\text{trim-down}} = \left( \frac{499}{10} - 9.98 \right) = 39.92 \text{ k}\Omega$$

**Trim Up – Increase Output Voltage**

Trimming up is accomplished by connecting an external resistor,  $R_{trim-up}$ , between the TRIM (pin 12) and the SENSE+ (pin 11), with a value of:

$$R_{trim-up} = 4.99 * \left\{ \left[ \frac{VO(NOM) * (100 + \Delta)}{1.25\Delta} \right] - \frac{(100 + 2\Delta)}{\Delta} \right\} \quad [k\Omega]$$

**Fig. 4: Circuit configuration for Trim-up function**

To trim the output voltage up, for example 24V to 26.4V,  $\Delta=10$  and required external resistor is:

$$R_{trim-up} = 4.99 * \left\{ \left[ \frac{24 * (100 + 10)}{1.25 * 10} \right] - \frac{(100 + 2 * 10)}{10} \right\} = 1015 \text{ k}\Omega$$

Note that trimming output voltage more than 10% is not recommended and OVP may be tripped.

**Active Voltage Programming**

In applications where output voltage need to be adjusted actively, an external voltage source, such as for example a Digital-to-Analog converter (DAC), capable of both sourcing and sinking current can be used. It should be connected across with series resistor  $R_g$  across TRIM (Pin 12) and SENSE- (Pin 10). External trim voltage should not be applied before converter is enabled in order to provide proper startup output voltage waveform and prevent tripping overvoltage protection. Please contact Murata technical representative for more details.

**Thermal Consideration**

The ICF converter can operate in a variety of thermal environment. However, in order to ensure reliable operation of the converter, sufficient cooling should be provided. The ICF converter is encapsulated in plastic case with metal baseplate on the top. In order to improve thermal performance, power components inside the unit are thermally coupled to the baseplate. In addition, thermal design of the converter is enhanced by use of input and output pins as heat transfer elements. Heat is removed from the converter by conduction, convection and radiation. There are several factors such as ambient temperature, airflow,

Wide Input 1000 Watt Isolated Full Brick DC-DC converter power dissipation, converter orientation how converter is

mounted as well as the need for increased reliability that need to be taken into account in order to achieve required performance. It is highly recommended to measure temperature in the middle of the baseplate in particular application to ensure that proper cooling of the converter is provided. A reduction in the operating temperature of the converter will result in increased reliability.

**Thermal Derating**

There are two most common applications: 1) the ICF converter is thermally attached to a cold plate inside chassis without any forced internal air circulation; 2) the ICF converter is mounted in an open chassis on system board with forced airflow with or without an additional heatsink attached to the base plate of the ICF converter.

The best thermal results are achieved in application 1) since the converter is cooled entirely by conduction of heat from the top surface of the converter to a cold plate and temperature of the components is determined by the temperature of the cold plate. There is also some additional heat removal through the converter's pins to the metal layers in the system board. It is highly recommended to solder pins to the system board rather than using receptacles. Typical derating output power and current are shown in Figs. 10–13 for various baseplate temperatures up to 105°C. Note that operating the converter at these limits for prolonged time will affect reliability.

**Soldering Guidelines**

The RoHS-compliant through-hole ICF converters use Sn/Ag/Cu Pb-free solder and RoHS-compliant component. They are designed to be processed through wave soldering machines. The pins are 100% matte tin over nickel plated and compatible with both Pb and Pb-free wave soldering processes. It is recommended to follow specifications below when installing and soldering ICF converters. Exceeding these specifications may cause damage to the ICF converter.

Wave Solder Guideline For Sn/Ag/Cu based solders	
Maximum Preheat Temperature	115 °C
Maximum Pot Temperature	270 °C
Maximum Solder Dwell Time	7 seconds
Wave Solder Guideline For Sn/Pb based solders	
Maximum Preheat Temperature	105 °C
Maximum Pot Temperature	250 °C
Maximum Solder Dwell Time	6 seconds

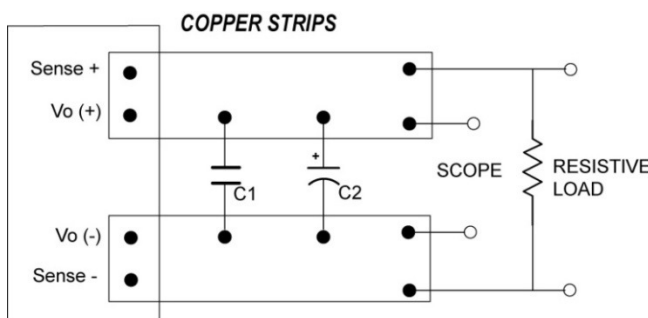

NOTE: ICF converters are not recommended for water wash process. Contact the factory for additional information if water wash is necessary.

Fig. 39: Turn-on by ON/OFF transient ( $V_{in}$  applied) at full rated load current (resistive) at  $V_{in} = 24V$ . Top trace (C1): ON/OFF signal (5 V/div.). Bottom trace (C4): Output voltage (10 V/div.). Time: 5 ms/div.

Fig. 40: Turn-on by  $V_{in}$  (ON/OFF high) transient at full rated load current (resistive) at  $V_{in} = 24V$ . Top trace (C2): Input voltage  $V_{in}$  (10 V/div.). Bottom trace (C4): Output voltage (10 V/div.). Time: 100 ms/div.

Fig. 41: Output voltage response to load current step change 50% - 75%-50% (18A–27A–18A) with  $di/dt = 1A/\mu s$  at  $V_{in} = 24V$ . Top trace (C4): Output voltage (200 mV/div.). Bottom trace (C3): Load current (10A/div.).  $C_o = 470\mu F/70m\Omega$ . Time: 1ms/div.

Fig. 42: Output voltage response to load current step change 50% - 100%-50% (18A–36A–18A) with  $di/dt = 1A/\mu s$  at  $V_{in} = 24V$ . Top trace (C4): Output voltage (500 mV/div.). Bottom trace (C3): Load current (10A/div.).  $C_o = 470\mu F/70m\Omega$ . Time: 1ms/div.

Fig. 43: Output voltage ripple (100 mV/div.) at full rated load current into a resistive load at  $V_{in} = 24V$ .  $C_o = 470\mu F/70m\Omega$ . Time: 2  $\mu s$ /div.

Fig. 44: Input reflected ripple current,  $i_c$  (500 mA/div.), measured at input terminals at full rated load current at  $V_{in} = 24V$ . Refer to Fig. 2 for test setup. Time: 2  $\mu s$ /div. RMS input ripple current is  $4.968 \times 0.5A = 2.48A_{rms}$ .

**Characteristic Waveforms – ICF0621V1**

Fig. 45: Turn-on by ON/OFF transient ( $V_{in}$  applied) at full rated load current (resistive) at  $V_{in} = 24V$ . Top trace (C1): ON/OFF signal (5 V/div.). Bottom trace (C4): Output voltage (10 V/div.). Time: 10 ms/div.

Fig. 46: Turn-on by  $V_{in}$  (ON/OFF high) transient at full rated load current (resistive) at  $V_{in} = 24V$ . Top trace (C2): Input voltage  $V_{in}$  (10 V/div.). Bottom trace (C4): Output voltage (10 V/div.). Time: 100 ms/div.

Fig. 47: Output voltage response to load current step change 50% - 75%-50% (10.5A–15.75A–10.5A) with  $di/dt = 1A/\mu s$  at  $V_{in} = 24V$ . Top trace (C4): Output voltage (200 mV/div.). Bottom trace (C3): Load current (10A/div.). Time: 1ms/div.

Fig. 48: Output voltage to load current step change 50% - 100%-50% (10.5A–21A–10.5A) with  $di/dt = 1A/\mu s$  at  $V_{in} = 24V$ . Top trace (C4): Output voltage (500 mV/div.). Bottom trace (C3): Load current (10A/div.). Time: 1ms/div.

Fig. 49: Output voltage ripple (100 mV/div.) at full rated load current into a resistive load at  $V_{in} = 24V$ . Time: 2  $\mu s$ /div.

Fig. 50: Input reflected ripple current,  $i_c$  (500 mA/div.), measured at input terminals at full rated load current at  $V_{in} = 24V$ . Refer to Fig. 2 for test setup. Time: 2  $\mu s$ /div. RMS input ripple current is  $7.3 \cdot 0.5A = 3.65A_{rms}$ .

Characteristic Waveforms – ICF0719V1

Fig. 51: Turn-on by ON/OFF transient ( $V_{in}$  applied) at full rated load current (resistive) at  $V_{in} = 24V$ . Top trace (C1): ON/OFF signal (5 V/div.). Bottom trace (C4): Output voltage (10 V/div.). Time: 10 ms/div.

Fig. 52: Turn-on by  $V_{in}$  (ON/OFF high) transient at full rated load current (resistive) at  $V_{in} = 24V$ . Top trace (C2): Input voltage  $V_{in}$  (10 V/div.). Bottom trace (C4): Output voltage (10 V/div.). Time: 100 ms/div.

Fig. 53: Output voltage response to load current step change 50% - 75%-50% (9.5A–14.25A–9.5A) with  $di/dt = 1A/\mu s$  at  $V_{in} = 24V$ . Top trace (C4): Output voltage (200 mV/div.). Bottom trace (C3): Load current (10A/div.). Time: 1ms/div.

Fig. 54: Output voltage response to load current step change 50% - 100%-50% (9.5A–19A–9.5A) with  $di/dt = 1A/\mu s$  at  $V_{in} = 24V$ . Top trace (C4): Output voltage (500 mV/div.). Bottom trace (C3): Load current (10A/div.). Time: 1ms/div.

Fig. 55: Output voltage ripple (100 mV/div.) at full rated load current into a resistive load at  $V_{in} = 24V$ . Time: 2  $\mu s$ /div.

Fig. 56: Input reflected ripple current,  $i_c$  (500 mA/div.), measured at input terminals at full rated load current at  $V_{in} = 24V$ . Refer to Fig. 2 for test setup. Time: 2  $\mu s$ /div. RMS input ripple current is  $4.968 \times 0.5A = 2.48A_{rms}$ .

**EMC Consideration:**

Wide Input 1000 Watt Isolated Full Brick DC-DC

The filter circuit schematic for suggested input filter configuration as tested to meet the conducted emission limits of MILSTD-461F CE102 Base Curve is shown in Fig. 57. The plots of conducted EMI spectrum measured using 5uH LISNs are shown in Fig. 58.

Note: Customer is ultimately responsible for the proper selection, component rating and verification of the suggested parts based on the endapplication.

Comp. Des.	Description
C1, C2, C12, C14	470μF/50V/70mΩ Electrolytic Capacitor (Vishay MAL214699108E3 or equivalent)
C3, C4, C5, C6	4.7nF/1210/X7R/1500V Ceramic Capacitor
C7, C8, C9, C10, C11, C13	10μF/1210/X7R/50V Ceramic Capacitor
L1	CM choke, 130uH, Leakage = 0.6uH (4T on toroid 22.1mm x 13.7 mm x 7.92 mm)

Fig. 57: Typical input EMI filter circuit to attenuate conducted emissions per MILSTD-461F CE102 Base Curve.

a) Without input filter from Fig. 57 (C9 = 2 x 470μF/50V/70mΩ)

b) With input filter from Fig. 57.

Fig. 58: Input conducted emissions measurement (Typ.) of ICF0442V1.

**Mechanical Specifications:**

Input/Output Connections		
Pin	Label	Function
1	+ON/OFF	TTL input with internal pull up, referenced to ON/OFF pin, used to turn converter on and off
2	-ON/OFF	Negative input of Remote ON/OFF
3	-INPUT	Negative Input Voltage
3A	-INPUT	Negative Input Voltage
4	+INPUT	Positive Input Voltage
4A	+INPUT	Positive Input Voltage
5	+OUT	Positive Output Voltage
6	+OUT	Positive Output Voltage
8	-OUT	Negative Output Voltage
9	-OUT	Negative Output Voltage
10	SENSE-	Negative Remote Sense
11	SENSE+	Positive Remote Sense
12	TRIM	Used to trim output voltage +10/-40%

NOTE: Pinout as well as pin number and pin diameter are inconsistent between manufacturers of the full brick converters. Make sure to follow the pin function, not the pin number, as well as spec for pin diameter when laying out your board.

**NOTES:**

Unless otherwise specified:  
 All dimensions are in inches [millimeter]  
 Tolerances: x.xx in. ±0.02 in. [x.x mm ± 0.5mm]  
 x.xxx in. ±0.010 in. [x.xx mm ± 0.25mm]

Torque fasteners into threaded mounting inserts at 10 in.lbs. or less. Greater torque may result in damage to unit and void the warranty.

**Packaging Information:**

**Wide Input 1000 Watt Isolated Full Brick DC-DC**

1. SHIPPING TUBE MATERIAL: ANTI-STATIC PVC
2. ALL END VIEW DIMENSIONS ARE INSIDE DIMENSIONS.
3. ALL DIMENSIONS ARE  $\pm 0.010$ ".
4. CARDBOARD SHIPPING BOX IS 16" X 10" X 10"
5. MAXIMUM NUMBER OF UNITS (MPQ) PER BOX IS 55 CONVERTERS.
6. BOX IS TOP FILLED WITH ANTI-STATIC SHIPPING PEANUTS

Murata Power Solutions, Inc.  
 129 Flanders Road, Westborough MA 01581 U.S.A.  
 ISO 9001 and 14001 REGISTERED
