

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

High Performance 6-Axis OIS/EIS Optimized MEMS Sensor

GENERAL DESCRIPTION

The ICG-20660 is a 6-axis MotionTracking device that combines a 3-axis gyroscope, 3-axis accelerometer, in a small 3 mm x 3 mm x 0.75 mm (16-pin LGA) package.

- High performance specs
 - Gyroscope sensitivity error: $\pm 3\%$
 - Gyroscope noise: $6.5 \text{mdps}/\sqrt{\text{Hz}}$
- Includes 512-byte FIFO to reduce traffic on the serial bus interface, and reduce power consumption by allowing the system processor to burst read sensor data and then go into a low-power mode
- EIS FSYNC support

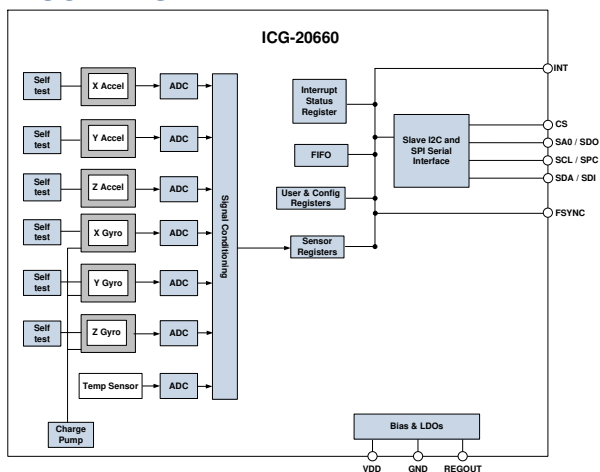

The ICG-20660 includes on-chip 16-bit ADCs, programmable digital filters, an embedded temperature sensor, and programmable interrupts. The device features an operating voltage range down to 1.71 V. Communication ports include I²C and high speed SPI at 7 MHz.

ORDERING INFORMATION

PART	AXES	TEMP RANGE	PACKAGE
ICG-20660 [†]	X,Y,Z	-40°C to +85°C	16-Pin LGA

[†]Denotes RoHS and Green-Compliant Package

BLOCK DIAGRAM

APPLICATIONS

- OIS (Optical Image Stabilization) in phone camera modules, DSLR, and DSC
- EIS (Electronic Image Stabilization) in DSC, and phone camera modules

FEATURES

- $\pm 3\%$ Gyro initial sensitivity
- 3-Axis optimized OIS/EIS programmable gyro FSR of $\pm 125 \text{dps}$, $\pm 250 \text{dps}$, $\pm 500 \text{dps}$, and $\pm 250 \text{dps}$
- 3-Axis Accelerometer with Programmable FSR of $\pm 2g$, $\pm 4g$, $\pm 8g$, and $\pm 16g$
- User-programmable interrupts
- Wake-on-motion interrupt for low power operation of applications processor
- 512-byte FIFO buffer enables the applications processor to read the data in bursts
- On-Chip 16-bit ADCs and Programmable Filters
- Host interface: 7 MHz SPI or 400 kHz Fast Mode I²C
- Digital-output temperature sensor
- VDD operating range of 1.71 V to 3.45 V
- MEMS structure hermetically sealed and bonded at wafer level
- RoHS and Green compliant

1 INTRODUCTION

1.1 PURPOSE AND SCOPE

This document provides a description, specifications, and design-related information on the ICG-20660 MotionTracking device for imaging applications, such as Optical Image Stabilization, OIS, or Electronic Image Stabilization, EIS. The device is housed in a small 3 mm x 3 mm x 0.75 mm 16-pin LGA package.

1.2 PRODUCT OVERVIEW

The ICG-20660 is a 6-axis MotionTracking device that combines a 3-axis gyroscope, and a 3-axis accelerometer in a small 3 mm x 3 mm x 0.75 mm (16-pin LGA) package. The 6-axis sensor allows efficient implementation of advanced 5- and 6-axes Optical Image Stabilization in high-end still and video cameras. It also features a 512-byte FIFO for EIS applications to lower the traffic on the serial bus interface, and reduce power consumption by allowing the system processor to burst read sensor data for a given video frame. The unique support for FSYNC (frame sync), facilitates synchronization of Video Frame Sync from Image sensors and Motion data from the gyroscopes and accelerators collected during a given frame via an interrupt to the host. ICG-20660, with its 6-axis integration, enables manufacturers to eliminate the costly and complex selection, qualification, and system level integration of discrete devices.

The gyroscope has a programmable full-scale range of ± 125 dps, ± 250 dps, and ± 500 dps, optimized for Image Stabilization applications. The accelerometer has a user-programmable accelerometer full-scale range of $\pm 2g$, $\pm 4g$, $\pm 8g$, and $\pm 16g$. Factory-calibrated initial sensitivity of both sensors reduces production-line calibration requirements.

Other industry-leading features include on-chip 16-bit ADCs, programmable digital filters, an embedded temperature sensor, and programmable interrupts. The device features I²C and SPI serial interfaces, a VDD operating range of 1.71 V to 3.6 V, and a separate digital IO supply, VDDIO from 1.71 V to 3.6 V.

Communication with all registers of the device is performed using either I²C at 400 kHz or SPI at 7 MHz.

By leveraging its patented and volume-proven CMOS-MEMS fabrication platform, which integrates MEMS wafers with companion CMOS electronics through wafer-level bonding, InvenSense has driven the package size down to a footprint and thickness of 3x3x0.75 mm (16-pin LGA), to provide a very small yet high-performance, low-cost package. The device provides high robustness by supporting 10,000g shock reliability.

1.3 APPLICATIONS

- *OIS*, Optical Image Stabilization in phone camera modules, DSLR, and DSC
- *EIS*, Electronic Image Stabilization in DSC, and phone camera modules

2 FEATURES

2.1 GYROSCOPE FEATURES

The triple-axis MEMS gyroscope in the ICG-20660 includes a wide range of features:

- Digital-output X-, Y-, and Z-axis angular rate sensors (gyroscopes) with a user-programmable full-scale range of ± 125 dps, ± 250 dps, and ± 500 dps and integrated 16-bit ADCs
- Digitally-programmable low-pass filter
- Factory calibrated sensitivity scale factor
- Self-test

2.2 ACCELEROMETER FEATURES

The triple-axis MEMS accelerometer in ICG-20660 includes a wide range of features:

- Digital-output X-, Y-, and Z-axis accelerometer with a programmable full scale range of $\pm 2g$, $\pm 4g$, $\pm 8g$, and $\pm 16g$ and integrated 16-bit ADCs
- User-programmable interrupts
- Wake-on-motion interrupt for low power operation of applications processor
- Self-test

2.3 ADDITIONAL FEATURES

The ICG-20660 includes the following additional features:

- Minimal cross-axis sensitivity between the accelerometer and gyroscope axes
- 512-byte FIFO buffer enable the applications processor to read the data in bursts
- Digital-output temperature sensor
- User-programmable digital filters for gyroscope, accelerometer, and temp sensor
- 10,000g shock tolerant
- 400 kHz Fast Mode I²C for communicating with all registers
- 7 MHz SPI serial interface for communicating with all registers
- MEMS structure hermetically sealed and bonded at wafer level
- RoHS and Green compliant

3 ELECTRICAL CHARACTERISTICS

3.1 GYROSCOPE SPECIFICATIONS

Typical Operating Circuit of section 0, VDD = 1.8 V, VDDIO = 1.8 V, T_A=25°C, unless otherwise noted.

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
GYROSCOPE SENSITIVITY						
Full-Scale Range	FS_SEL = 0		±125		dps	3
	FS_SEL = 1		±250		dps	3
	FS_SEL = 2		±500		dps	3
ADC Word Length			16		bits	3
Sensitivity Scale Factor	FS_SEL = 0		262		LSB/(dps)	3
	FS_SEL = 1		131		LSB/(dps)	3
	FS_SEL = 2		65.5		LSB/(dps)	3
Initial Sensitivity Scale Factor Tolerance	25°C		±3		%	2
Sensitivity Scale Factor Variation Over Temperature	-20°C to +75°C		±3		%	1
Nonlinearity	Best fit straight line; 25°C		±0.1		%	1
Cross-Axis Sensitivity			±5		%	1
ZERO-RATE OUTPUT (ZRO)						
Initial ZRO Tolerance	25°C		±5		dps	2
ZRO Variation Over Temperature	-20°C to +75°C		±5		dps	1
GYROSCOPE NOISE PERFORMANCE (FS_SEL = 0)						
Total RMS Noise	DLPFCFG = 2 (92 Hz)		0.075		dps-rms	2
	DLPFCFG = 1 (176 Hz)		0.10		dps-rms	2
	DLPFCFG = 0 (250 Hz)		0.12		dps-rms	2
Total Peak-to-Peak Noise	DLPFCFG = 2 (92 Hz)		0.37		dps-p-p	2
	DLPFCFG = 1 (176 Hz)		0.50		dps-p-p	2
	DLPFCFG = 0 (250 Hz)		0.60		dps-p-p	2
Rate Noise Spectral Density	At 10 Hz		0.0065		dps /√Hz	4
GYROSCOPE MECHANICAL						
Mechanical Frequency		25.6	27	29	kHz	2
Sensor Mechanical Bandwidth		1.2			kHz	1
LOW PASS FILTER RESPONSE						
	Programmable Range	92		250	Hz	3
GYROSCOPE START-UP TIME						
			80		ms	1
OUTPUT DATA RATE						
	Programmable, Normal (Filtered) mode	1000		8000	Hz	1

Table 1. Gyroscope Specifications

Notes:

1. Derived from validation or characterization of parts, not guaranteed in production.
2. Tested in production.
3. Guaranteed by design.
4. Calculated from Total RMS Noise.

3.2 ACCELEROMETER SPECIFICATIONS

Typical Operating Circuit of section 0, VDD = 1.8 V, VDDIO = 1.8 V, T_A=25°C, unless otherwise noted.

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
ACCELEROMETER SENSITIVITY						
Full-Scale Range	AFS_SEL = 0		±2		g	3
	AFS_SEL = 1		±4		g	3
	AFS_SEL = 2		±8		g	3
	AFS_SEL = 3		±16		g	3
ADC Word Length	Output in two's complement format		16		bits	3
Sensitivity Scale Factor	AFS_SEL = 0		16,384		LSB/g	3
	AFS_SEL = 1		8,192		LSB/g	3
	AFS_SEL = 2		4,096		LSB/g	3
	AFS_SEL = 3		2,048		LSB/g	3
Sensitivity Initial Tolerance	Component-level		±1		%	2
Sensitivity Change vs. Temperature	-20°C to +75°C AFS_SEL = 0 Component-level		±2.5		%	1
Nonlinearity	Best Fit Straight Line		±0.5		%	1
Cross-Axis Sensitivity			±2		%	1
ZERO-G OUTPUT						
Initial Tolerance	Component-level, X and Y axes		±40		mg	2
	Component-level, Z axis		±65		mg	2
Zero-G Level Change vs. Temperature	-20°C to +75°C		±50		mg	1
NOISE PERFORMANCE						
Power Spectral Density			220		μg/√Hz	4
Total RMS Noise	DLPFCFG = 2 (100 Hz)		2		mg-rms	2
LOW PASS FILTER RESPONSE	Programmable Range	5		260	Hz	3
INTELLIGENCE FUNCTION INCREMENT			4		mg/LSB	3
ACCELEROMETER STARTUP TIME	From Sleep mode		20		ms	1
	From Cold Start, 1ms VDD ramp		30		ms	1
OUTPUT DATA RATE	Low power (duty-cycled)	0.24		500	Hz	1
	Duty-cycled, over temp		±15		%	
	Low noise (active)	4		4000	Hz	

Table 2. Accelerometer Specifications

Notes:

1. Derived from validation or characterization of parts, not guaranteed in production.
2. Tested in production.
3. Guaranteed by design.
4. Calculated from Total RMS Noise.

3.3 ELECTRICAL SPECIFICATIONS

3.3.1 D.C. Electrical Characteristics

Typical Operating Circuit of section 0, VDD = 1.8 V, VDDIO = 1.8 V, T_A=25°C, unless otherwise noted.

PARAMETER	CONDITIONS	MIN	TYP	MAX	Units	Notes
SUPPLY VOLTAGES

3.6 ABSOLUTE MAXIMUM RATINGS

Stress above those listed as “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to the absolute maximum ratings conditions for extended periods may affect device reliability.

Parameter	Rating
Supply Voltage, VDD	-0.5 V to +4 V
Supply Voltage, VDDIO	-0.5 V to +4 V
REGOUT	-0.5 V to 2 V
Input Voltage Level (SA0, FSYNC, SCL, SDA)	-0.5 V to VDD + 0.5 V
Acceleration (Any Axis, unpowered)	10,000g for 0.2 ms
Storage Temperature Range	-40°C to +125°C
Electrostatic Discharge (ESD) Protection	2 kV (HBM); 250 V (MM)
Latch-up	JEDEC Class II (2), 125°C ±100 mA

4 APPLICATIONS INFORMATION

4.1 PIN OUT DIAGRAM AND SIGNAL DESCRIPTION

Pin Number	Pin Name	Pin Description
1	VDDIO	Digital I/O supply voltage
2	SCL/SPC	I ² C serial clock (SCL); SPI serial clock (SPC)
3	SDA/SDI	I ² C serial data (SDA); SPI serial data input (SDI)
4	SA0/SDO	I ² C slave address LSB (SA0); SPI serial data output (SDO)
5	CS	Chip select (0 = SPI mode; 1 = I ² C mode)
6	INT	Interrupt digital output (totem pole or open-drain)
7	RESV	Reserved. Do not connect.
8	FSYNC	Synchronization digital input (optional). Connect to GND if unused.
9	NC	Connect to GND or do not connect
10	NC	Connect to GND or do not connect
11	NC	Connect to GND or do not connect
12	NC	Connect to GND or do not connect
13	GND	Connect to GND
14	REGOUT	Regulator filter capacitor connection
15	RESV	Reserved. Connect to GND
16	VDD	Power Supply

4.4 BLOCK DIAGRAM

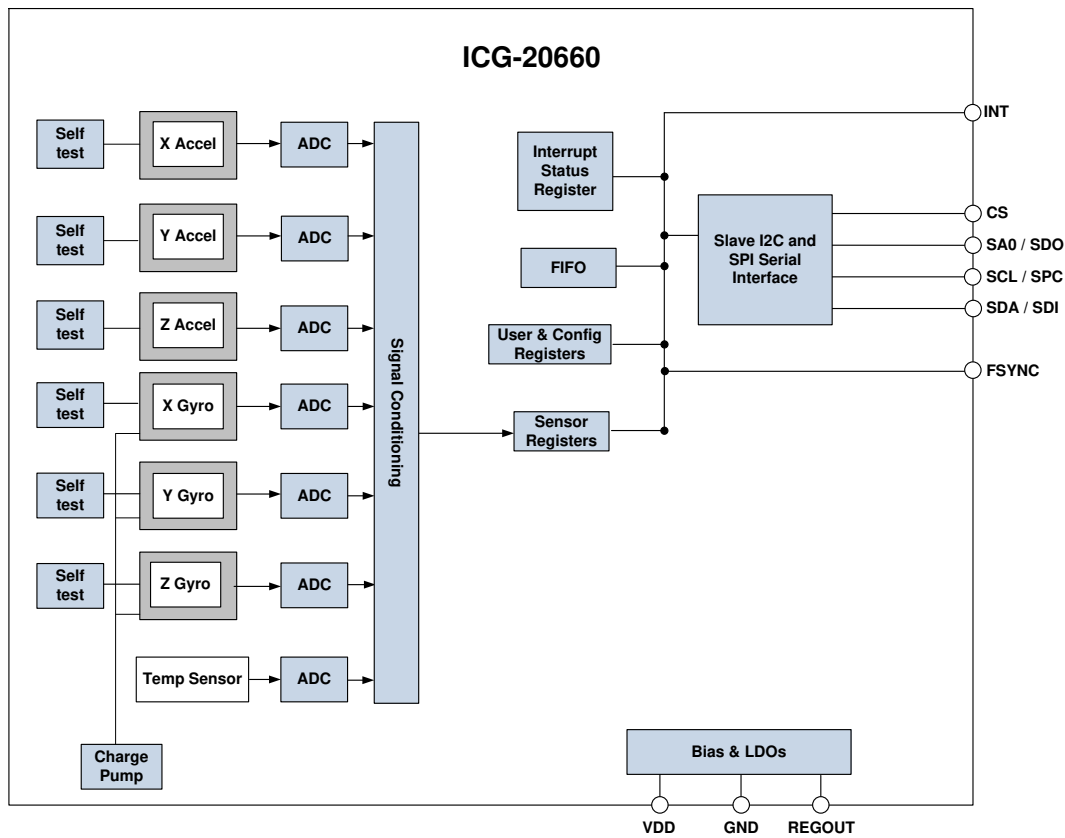

Figure 5. ICG-20660 Block Diagram

4.5 OVERVIEW

The ICG-20660 is comprised of the following key blocks and functions:

- Three-axis MEMS rate gyroscope sensor with 16-bit ADCs and signal conditioning
- Three-axis MEMS accelerometer sensor with 16-bit ADCs and signal conditioning
- Primary I²C and SPI serial communications interfaces
- Self-Test
- Clocking
- Sensor Data Registers
- FIFO
- Interrupts
- Digital-Output Temperature Sensor
- Bias and LDOs
- Charge Pump
- Standard Power Modes

4.6 THREE-AXIS MEMS GYROSCOPE WITH 16-BIT ADCS AND SIGNAL CONDITIONING

The ICG-20660 consists of three independent vibratory MEMS rate gyroscopes, which detect rotation about the X-, Y-, and Z- Axes. When the gyros are rotated about any of the sense axes, the Coriolis Effect causes a vibration that is detected by a capacitive pickoff. The resulting signal is amplified, demodulated, and filtered to produce a voltage that is proportional to the angular rate. This voltage is digitized using individual on-chip 16-bit Analog-to-Digital Converters (ADCs) to sample each axis. The full-scale range of the gyro sensors may be digitally programmed to ± 125 , ± 250 , or ± 500 degrees per second (dps). The ADC sample rate is programmable up to 8,000 samples per second with user-selectable low-pass filters enable a wide range of cut-off frequencies.

4.7 THREE-AXIS MEMS ACCELEROMETER WITH 16-BIT ADCS AND SIGNAL CONDITIONING

The ICG-20660's 3-Axis accelerometer uses separate proof masses for each axis. Acceleration along a particular axis induces displacement on the corresponding proof mass, and capacitive sensors detect the displacement differentially. The ICG-20660's architecture reduces the accelerometers' susceptibility to fabrication variations as well as to thermal drift. When the device is placed on a flat surface, it will measure 0g on the X- and Y-axes and +1g on the Z-axis. The accelerometers' scale factor is calibrated at the factory and is nominally independent of supply voltage. Each sensor has a dedicated sigma-delta ADC for providing digital outputs. The full scale range of the digital output can be adjusted to $\pm 2g$, $\pm 4g$, $\pm 8g$, or $\pm 16g$.

4.8 I²C AND SPI SERIAL COMMUNICATIONS INTERFACES

The ICG-20660 communicates to a system processor using either a SPI or an I²C serial interface. The ICG-20660 always acts as a slave when communicating to the system processor. The LSB of the I²C slave address is set by pin 4 (SA0).

4.8.1 ICG-20660 Solution Using I²C Interface

In the figure below, the system processor is an I²C master to the ICG-20660.

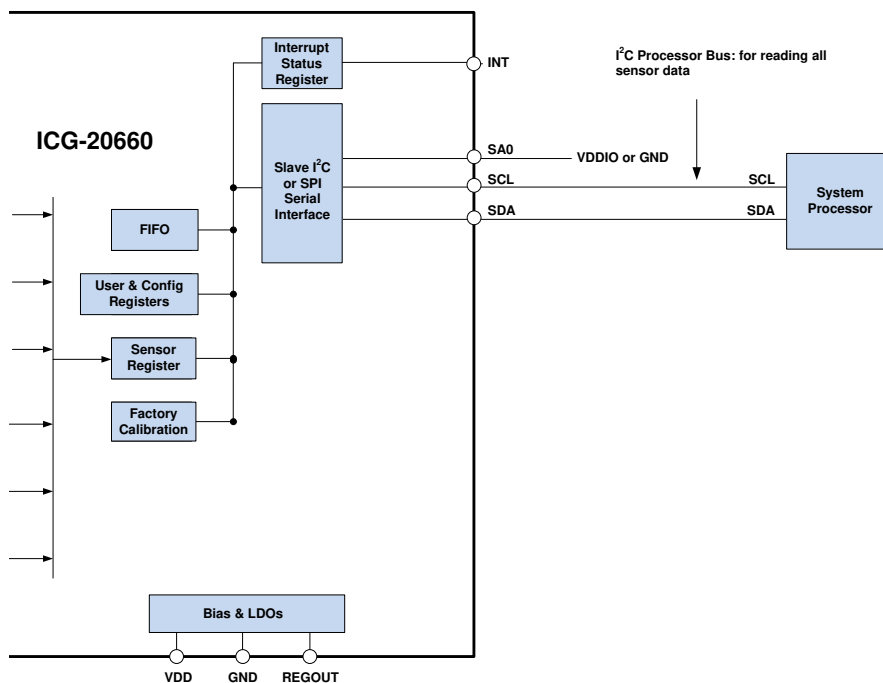

Figure 6. ICG-20660 Solution Using I²C Interface

4.8.2 ICG-20660 Solution Using SPI Interface

In the figure below, the system processor is an SPI master to the ICG-20660. Pins 2, 3, 4, and 5 are used to support the SPC, SDI, SDO, and CS signals for SPI communications.

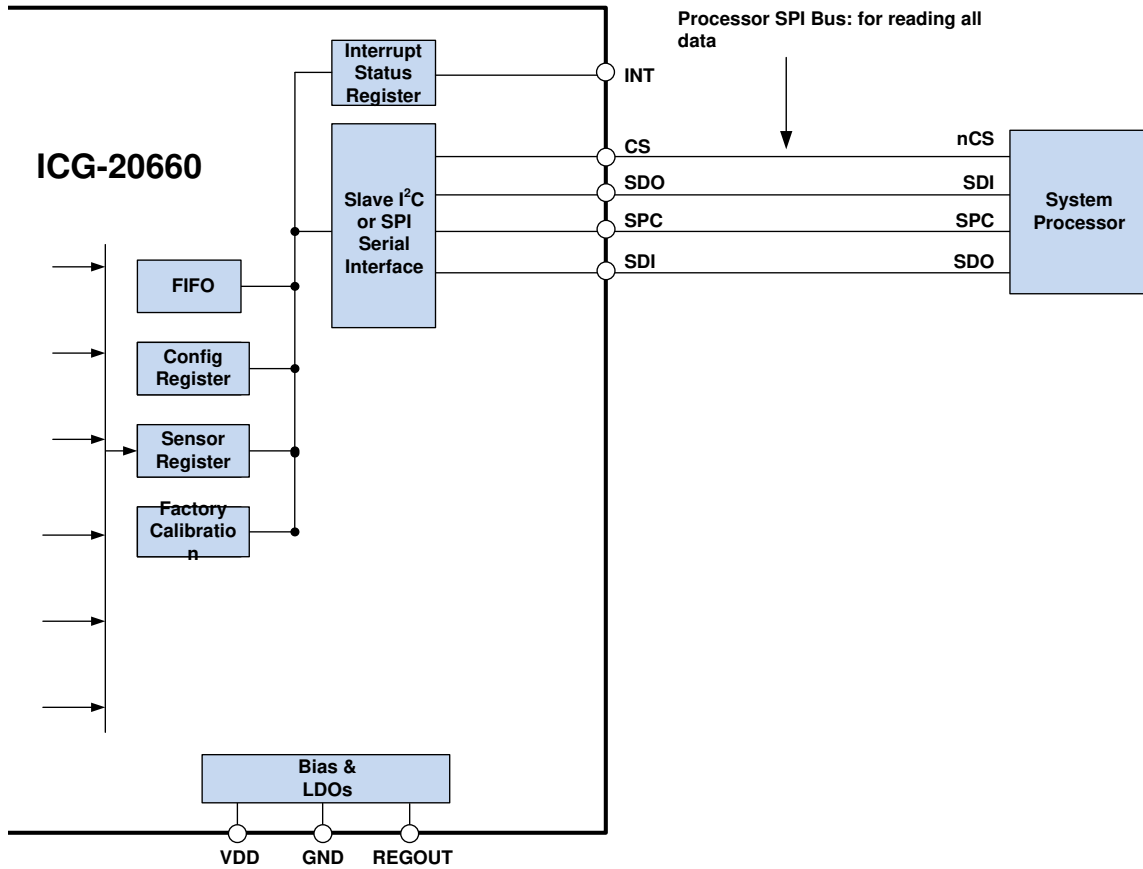

Figure 7. ICG-20660 Solution Using SPI Interface

4.9 SELF-TEST

Self-test allows for the testing of the mechanical and electrical portions of the sensors. The self-test for each measurement axis can be activated by means of the gyroscope and accelerometer self-test registers (registers 27 and 28).

When the self-test is activated, the electronics cause the sensors to be actuated and produce an output signal. The output signal is used to observe the self-test response.

The self-test response is defined as follows:

$$\text{SELF-TEST RESPONSE} = \text{SENSOR OUTPUT WITH SELF-TEST ENABLED} - \text{SENSOR OUTPUT WITH SELF-TEST DISABLED}$$

The self-test response for each gyroscope axis is defined in the gyroscope specification table, while that for each accelerometer axis is defined in the accelerometer specification table.

When the value of the self-test response is within the specified min/max limits of the product specification, the part has passed self-test. When the self-test response exceeds the min/max values, the part is deemed to have failed self-test. It is recommended to use InvenSense MotionApps software for executing self-test.

For further information on Self-Test please refer to the register map of ICG-20660.

4.10 CLOCKING

The ICG-20660 has a flexible clocking scheme, allowing a variety of internal clock sources to be used for the internal synchronous circuitry. This synchronous circuitry includes the signal conditioning and ADCs, and various control circuits and registers. An on-chip PLL provides flexibility in the allowable inputs for generating this clock.

Allowable internal sources for generating the internal clock are:

a) An internal relaxation oscillator

b) Auto-select between internal relaxation oscillator and gyroscope MEMS oscillator to use the best available source

The only setting supporting specified performance in all modes is option b). It is recommended that option b) be used.

4.11 SENSOR DATA REGISTERS

The sensor data registers contain the latest gyroscope, accelerometer, and temperature measurement data. They are read-only registers, and are accessed via the serial interface. Data from these registers may be read anytime.

4.12 FIFO

The ICG-20660 contains a 512-byte FIFO register that is accessible via the Serial Interface. The FIFO configuration register determines which data is written into the FIFO. Possible choices include gyro data, accelerometer data, temperature readings, and FSYNC input. A FIFO counter keeps track of how many bytes of valid data are contained in the FIFO. The FIFO register supports burst reads. The interrupt function may be used to determine when new data is available.

The ICG-20660 allows FIFO read in low-power accelerometer mode.

For further information regarding the FIFO, please refer to the register map of ICG-20660.

4.13 INTERRUPTS

Interrupt functionality is configured via the Interrupt Configuration register. Items that are configurable include the INT pin configuration, the interrupt latching and clearing method, and triggers for the interrupt. Items that can trigger an interrupt are (1) Clock generator locked to new reference oscillator (used when switching clock sources); (2) new data is available to be read (from the FIFO and Data registers); (3) accelerometer event interrupts; (4) FIFO overflow. The interrupt status can be read from the Interrupt Status register.

4.14 DIGITAL-OUTPUT TEMPERATURE SENSOR

An on-chip temperature sensor and ADC are used to measure the ICG-20660 die temperature. The readings from the ADC can be read from the FIFO or the Sensor Data registers.

4.15 BIAS AND LDOS

The bias and LDO section generates the internal supply and the reference voltages and currents required by the ICG-20660. Its two inputs are an unregulated VDD and a VDDIO logic reference supply voltage. The LDO output is bypassed by a capacitor at REGOUT. For further details on the capacitor, please refer to the Bill of Materials for External Components.

4.16 CHARGE PUMP

An on-chip charge pump generates the high voltage required for the MEMS oscillator.

4.17 STANDARD POWER MODES

The following table lists the user-accessible power modes for ICG-20660.

Mode	Name	Gyro	Accel
1	Sleep Mode	Off	Off
2	Standby Mode	Drive On	Off
3	Accelerometer Low-Power Mode	Off	Duty-Cycled
4	Accelerometer Low-Noise Mode	Off	On
7	6-Axis Low-Noise Mode	On	On

Table 11. Standard Power Modes for ICG-20660

Notes:

1. Power consumption for individual modes can be found in section 0.

5 PROGRAMMABLE INTERRUPTS

The ICG-20660 has a programmable interrupt system which can generate an interrupt signal on the INT pin. Status flags indicate the source of an interrupt. Interrupt sources may be enabled and disabled individually.

Interrupt Name	Module
Motion Detection	Motion
FIFO Overflow	FIFO
Data Ready	Sensor Registers

Table 12. Table of Interrupt Sources

For information regarding the interrupt enable/disable registers and flag registers, please refer to the register map of ICG-20660 in this document.

6 DIGITAL INTERFACE

6.1 I²C AND SPI SERIAL INTERFACES

The internal registers and memory of the ICG-20660 can be accessed using either I²C at 400 kHz or SPI at 7 MHz. SPI operates in four-wire mode.

Pin Number	Pin Name	Pin Description
1	VDDIO	Digital I/O supply voltage.
4	SA0 / SDO	I ² C Slave Address LSB (SA0); SPI serial data output (SDO)
2	SCL / SPC	I ² C serial clock (SCL); SPI serial clock (SPC)
3	SDA / SDI	I ² C serial data (SDA); SPI serial data input (SDI)

Table 13. Serial Interface

Note: To prevent switching into I²C mode when using SPI, the I²C interface should be disabled by setting the *I2C_IF_DIS* configuration bit. Setting this bit should be performed immediately after waiting for the time specified by the “Start-Up Time for Register Read/Write” in Section 6.3.

For further information regarding the *I2C_IF_DIS* bit, please refer to the register map of ICG-20660.

6.2 I²C INTERFACE

I²C is a two-wire interface comprised of the signals serial data (SDA) and serial clock (SCL). In general, the lines are open-drain and bi-directional. In a generalized I²C interface implementation, attached devices can be a master or a slave. The master device puts the slave address on the bus, and the slave device with the matching address acknowledges the master.

The ICG-20660 always operates as a slave device when communicating to the system processor, which thus acts as the master. SDA and SCL lines typically need pull-up resistors to VDD. The maximum bus speed is 400 kHz.

The slave address of the ICG-20660 is b110100X, which is 7 bits long. The LSB bit of the 7-bit address is determined by the logic level on pin SA0. This allows two ICG-20660s to be connected to the same I²C bus. When used in this configuration, the address of one of the devices should be b1101000 (pin SA0 is logic low) and the address of the other should be b1101001 (pin SA0 is logic high).

6.3 I²C COMMUNICATIONS PROTOCOL

START (S) and STOP (P) Conditions

Communication on the I²C bus starts when the master puts the START condition (S) on the bus, which is defined as a HIGH-to-LOW transition of the SDA line while SCL line is HIGH (see figure below). The bus is considered to be busy until the master puts a STOP condition (P) on the bus, which is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH (see figure below).

Additionally, the bus remains busy if a repeated START (Sr) is generated instead of a STOP condition.

Figure 8. START and STOP Conditions

Data Format / Acknowledge

I²C data bytes are defined to be 8-bits long. There is no restriction to the number of bytes transmitted per data transfer. Each byte transferred must be followed by an acknowledge (ACK) signal. The clock for the acknowledge signal is generated by the master, while the receiver generates the actual acknowledge signal by pulling down SDA and holding it low during the HIGH portion of the acknowledge clock pulse.

If a slave is busy and cannot transmit or receive another byte of data until some other task has been performed, it can hold SCL LOW, thus forcing the master into a wait state. Normal data transfer resumes when the slave is ready, and releases the clock line (refer to the following figure).

Figure 9. Acknowledge on the I²C Bus
