Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

2:1 MULTIPLEXER CHIP FOR PCI-EXPRESS

ICS557-08

Description

The ICS557-08 is a 2:1 multiplexer chip that allows the user to select one of the two HCSL (Host Clock Signal Level) or LVDS input pairs and fan out to one pair of differential HCSL or LVDS outputs. This chip is suited especially for PCI-Express applications, where there is a need to select the PCI-Express clock either locally from the PCI-E card or from the motherboard.

Features

- Packaged in 16-pin TSSOP
- Available in Pb (lead) free package
- Operating voltage of 3.3 V
- Low power consumption
- Input clock frequency of up to 200 MHz for HCSL and up to 100 MHz for LVDS

NOTE: EOL for non-green parts to occur on 5/13/10 per PDN U-09-01

Pin Descriptions

Pin	Pin Name	Pin Type	Pin Description
1	VDD	Power	Connect to +3.3 V. Supply voltage for Input clocks.
2	IN1	Input	HCSL/LVDS true input signal 1.
3	IN1	Input	HCSL/LVDS complimentary input signal 1.
4	PD	Input	Powers down the chip and tri-states outputs when low. Internal pull-up
5	IN2	Input	HCSL/LVDS true input signal 2.
6	IN2	Input	HCSL/LVDS complimentary input signal 2.
7	OE	Input	Provides output or, tri-states output (High = enable outputs; Low = disable). Internal pull-up resistor.
8	GND	Power	Connect to ground.
9	IREF	Output	Precision resistor attached to this pin is connected to the internal current
10	VDD	Power	Connect to +3.3 V. Supply Voltage for Output Clocks.
11	VDD	Power	Connect to +3.3 V. Supply Voltage for Output Clocks.
12	GND	Power	Connect to ground.
13	GND	Power	Connect to ground.
14	CLK	Output	HCSL/LVDS Complimentary output clock .
15	CLK	Output	HCSL/LVDS True output clock.
16	SEL	Input	SEL=1 selects IN1/$\overline{IN1}$. SEL =0 selects IN2/ $\overline{IN2}$. Internal pull-up resistor.

Application Information

Decoupling Capacitors

As with any high-performance mixed-signal IC, the ICS557-08 must be isolated from system power supply noise to perform optimally.

Decoupling capacitors of 0.01µF must be connected between each VDD and the PCB ground plane.

PCB Layout Recommendations

For optimum device performance and lowest output phase noise, the following guidelines should be observed.

Each 0.01µF decoupling capacitor should be mounted on the component side of the board as close to the VDD pin as possible. No vias should be used between decoupling capacitor and VDD pin. The PCB trace to VDD pin should be kept as short as possible, as should the PCB trace to the ground via. Distance of the ferrite bead and bulk decoupling from the device is less critical.

2) An optimum layout is one with all components on the same side of the board, minimizing vias through other signal layers (the ferrite bead and bulk decoupling capacitor can be mounted on the back). Other signal traces should be routed away from the ICS557-08.

This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

External Components

A minimum number of external components are required for proper operation. Decoupling capacitors of 0.01 µF should be connected between VDD and GND pins as close to the device as possible.

Current Reference Source R_r (Iref)

If board target trace impedance (Z) is 50Ω, then Rr = 475Ω (1%), providing IREF of 2.32 mA, output current (I_{OH}) is equal to 6*IREF.

Load Resistors R_L

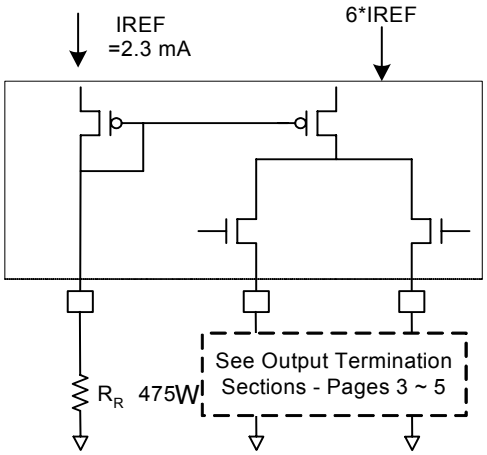
Since the clock outputs are open source outputs, 50Ω external resistors to ground are to be connected at each clock output.

Output Termination

The PCI-Express differential clock outputs of the ICS557-08 are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are shown in detail in the **PCI-Express Layout Guidelines** section.

The ICS557-08 can also be configured for LVDS compatible voltage levels. See the **LVDS Compatible Layout Guidelines** section.

Output Structures



General PCB Layout Recommendations

For optimum device performance and lowest output phase noise, the following guidelines should be observed.

1. Each 0.01µF decoupling capacitor should be mounted on the component side of the board as close to the VDD pin as possible.

2. No vias should be used between decoupling capacitor and VDD pin.

3. The PCB trace to VDD pin should be kept as short as possible, as should the PCB trace to the ground via. Distance of the ferrite bead and bulk decoupling from the device is less critical.

4. An optimum layout is one with all components on the same side of the board, minimizing vias through other signal layers (any ferrite beads and bulk decoupling capacitors can be mounted on the back). Other signal traces should be routed away from the ICS557-08.This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS557-08. These ratings are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Revision History

Rev.	Originator	Date	Description of Change
C	D.Chan	02/16/06	Added industrial temp range; updated PCI-Express Waveform diagram to include 0.525 V; changed “Supply Voltage, VDD” spec in Absolute Max. Ratings from 5.5 V to 7 V; changed CLKOUT to CLK and $\overline{CLK}$; added marking diagrams for I-temp device.
D	Arvind	05/17/07	Removed Cycle-to-cycle jitter spec.
E		06/26/07	Added 27mV to VOL max. spec
F		09/24/09	Added EOL note for non-green parts.
G		10/05/09	Updated “Input to Output Delay” parameter.
