## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Frequency Generator \& Integrated Buffers for PENTIUM II III ${ }^{\text {TM }}$ \& K6

## Recommended Application:

440BX, MX, VIA PM/PL/PLE 133 style chip set, with Coppermine or Tualatin processor, for note book applications.

## Output Features:

- 4 - CPUs @ $2.5 \mathrm{~V} / 3.3 \mathrm{~V}$
including 1 free running CPUCLK_F
- 9 - SDRAM @ 3.3V
- $7-\mathrm{PCI} @ 3.3 \mathrm{~V}$, including 1 free running PCICLK_F
- 1-PCI Early @ 3.3V
- $1-48 \mathrm{MHz}$, @ 3.3V fixed.
- $1-24 / 48 \mathrm{MHz} @ 3.3 \mathrm{~V}$
- 2 -REF @3.3V, 14.318MHz.

## Features:

- Up to 137 MHz frequency support
- 97MHz to support high-end AMD processor.
- Support power management: CLK, PCI, stop and Power down Mode from $I^{2} \mathrm{C}$ programming.
- Spread spectrum for EMI control
- Uses external 14.318MHz crystal
- FS pins for frequency select

Block Diagram

0375E—12/15/08

## Key Specifications:

- CPU Output Jitter @ 2.5V: <300ps
- CPU Output Jitter @ 3.3V: <250ps
- PCI Output Jitter @ 3.3V: <250ps
- CPU Output Skew @ 2.5V: <175ps
- CPU Output Skew @ 3.3V: <175ps
- PCI Output Skew @ 3.3V: <500ps
- PCI Early to PCI Skew @ 3.3V: typ = 3ns
- SDRAM Output Skew @ 3.3V: <500ps

Pin Configuration

48-Pin SSOP

* Internal Pull-up Resistor of 120K to VDD

Functionality

## Pin Descriptions

| PIN NUMBER | PIN NAME | TYPE | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1 | VDDREF | PWR | Ref, XTAL power supply, nominal 3.3V |
| 2 | SPREAD ${ }^{1,2}$ | IN | Active High Spread Spectrum enable input. Power-up default is "High", spreading is "on" |
|  | REF0 | OUT | 14.318 Mhz reference clock. This REF output is the STRONGER buffer for ISA BUS loads |
| 20 | PCI_STOP\# | IN | Halts PCICLK clocks at logic 0 level, when input low (In mobile mode, MODE=0) |
| $\begin{gathered} 3,9,16, \\ 33,40,44 \end{gathered}$ | GND | PWR | Ground |
| 4 | X1 | IN | Crystal input, has internal load cap (36pF) and feedback resistor from X2 |
| 5 | X2 | OUT | Crystal output, nominally 14.318 MHz . |
| 6,14 | VDDPCI | PWR | Supply for PCICLK_F and PCICLK nominal 3.3V |
| 7 | CPU2.5_3.3\#1,2 | IN | Indicates whether VDDLCPU is 2.5 or 3.3V. High=2.5V CPU, LOW=3.3V CPU. Latched Input. |
|  | PCICLK_F | OUT | Free running PCI clock not affected by PCI_STOP\# for power management. |
| 8 | FS3 ${ }^{1,2}$ | IN | Frequency select pin. Latched Input. |
|  | PCICLK0 | OUT | PCI clock output. Synchronous to CPU clocks with 1-4ns skew (CPU early) |
| 10 | SEL24_48\#1,2 | IN | Selects either 24 or 48 MHz when Low $=48 \mathrm{MHz}$ |
|  | PCICLK1 | OUT | PCI clock output. Synchronous to CPU clocks with 1-4ns skew (CPU early) |
| 11 | SELPCIE_6\#1,2 | IN | PCI Early or normal PCI select latch input. (for pin 18 power-up default is "High" early PCICLK.) |
|  | PCICLK2 | OUT | PCICLK clock output. |
| 17, 13, 12 | PCICLK (5:3) | OUT | PCI clock outputs. Synchronous to CPU clocks with 1-4ns skew (CPU early) |
| 15 | BUFFER IN | IN | Input to Fanout Buffers for SDRAM outputs. |
| 18 | $\begin{aligned} & \text { PCICLK6/PCICLK_- } \\ & \mathrm{E} \end{aligned}$ | OUT | PCI clock output or early PCI clock output selectable by SELPCIE_6\# |
| 19 | VDDCOR | PWR | Power pin for the PLL core. 3.3V |
| 21 | Vtt_PWRGND | IN | This pin acts as a dual function input pin for Vtt_PWRGD and PD\# signal. When Vtt_PWRGD goes high the frequency select will be latched at power on thereafter the pin is an asynchronous active low power down pin. |
|  | PD\# ${ }^{1}$ | IN | Asynchronous active low input pin used to power down the device into a low power state. The internal clocks are disabled and the VCO and the crystal are stopped. The latency of the power down will not be greater than 4 ms . |
| 22 | GND48 | PWR | Ground pin for the 24 \& 48MHz output buffers \& fixed PLL core. |
| $\begin{aligned} & 28,29,31,32, \\ & 34,35,37,38 \\ & \hline \end{aligned}$ | SDRAM (7:0) | OUT | SDRAM clock outputs, Fanout Buffer outputs from BUFFER IN pin (controlled by chipset). |
| 30, 36 | VDDSDR | PWR | Supply for SDRAM and CPU PLL Core, nominal 3.3V. |
| 23 | SDATA | IN | Data input for ${ }^{2} \mathrm{C}$ serial input, 5 V tolerant input |
| 24 | SCLK | IN | Clock input of $\mathrm{I}^{2} \mathrm{C}$ input, 5 V tolerant input |
| 25 | 24_48MHz | OUT | 24 MHz or 48 MHz output clock selectable by pin 10 |
|  | FS1 ${ }^{1,2}$ | IN | Frequency select pin. Latched Input. |
| 26 | 48 MHz | OUT | 48 MHz output clock |
|  | FS0 ${ }^{1,2}$ | IN | Frequency select pin. Latched Input |
| 27 | VDD48 | PWR | Power for 24 \& 48MHz output buffers and fixed PLL core. |
| 39 | SDRAM_F | OUT | Free running SDRAM clock output. Not affected by CPU_STOP\# |
| 41 | CLK_STOP\# | IN | This asynchronous input halts CPUCLK, \& SDRAM at logic "0" level when driven low. |
| 42, 43, 45 | CPUCLK (2:0) | OUT | CPU clock outputs, powered by VDDLCPU |
| 46 | CPUCLK_F | OUT | Free running CPU clock. Not affected by the CPU_STOP\# |
| 47 | VDDLCPU | PWR | Supply for CPU clocks 2.5 V |
| 48 | REF1 | OUT | 14.318 MHz reference clock. |
|  | FS2 ${ }^{1,2}$ | IN | Frequency select pin. Latched Input |

## Notes:

1: Internal Pull-up Resistor of 120 K to 3.3 V on indicated inputs
2: Bidirectional input/output pins, input logic levels are latched at internal power-on-reset. Use 10Kohm resistor to program logic Hi to VDD or GND for logic low.

## General Description

The ICS9248-195 is the single chip clock solution for Notebook designs using the 440BX, MX, VIA PM/PL/PLE 133 style chip set, with Coppermine or Tualatin processor, for Note book applications. It provides all necessary clock signals for such a system.

Spread spectrum may be enabled through $I^{2} \mathrm{C}$ programming. Spread spectrum typically reduces system EMI by 8 dB to 10 dB . This simplifies EMI qualification without resorting to board design iterations or costly shielding. The ICS9248195 employs a proprietary closed loop design, which tightly controls the percentage of spreading over process and temperature variations.

## Notes:

1, Default at Power-up will be for latched logic inputs to define frequency. Bit [2, 6:4] are default to 0011.
2, PWD = Power-Up Default

Byte 1: Active/Inactive Register (1 = enable, $0=$ disable)

| Bit | Pin \# | PWD | Description |
| :---: | :---: | :---: | :--- |
| Bit 7 | - | 1 | (Reserved) |
| Bit 6 | 46 | 1 | CPUCLK_F (En/Dis) |
| Bit 5 | - | 0 | (Reserved) |
| Bit 4 | - | 0 | (Reserved) |
| Bit 3 | 39 | 1 | SDRAM_F (En/Dis) |
| Bit 2 | 42 | 1 | CPUCLK2 (En/Dis) |
| Bit 1 | 43 | 1 | CPUCLK1 (En/Dis) |
| Bit 0 | 45 | 1 | CPUCLK0 (En/Dis) |

Byte 2: Active/Inactive Register (1 = enable, 0 = disable)

| Bit | Pin \# | PWD | Description |
| :---: | :---: | :---: | :--- |
| Bit 7 | 7 | 1 | PCICLK_F (En/Dis) |
| Bit 6 | 18 | 1 | PCICLK6 (En/Dis) |
| Bit 5 | 17 | 1 | PCICLK5 (En/Dis) |
| Bit 4 | 13 | 1 | PCICLK4 (En/Dis) |
| Bit 3 | 12 | 1 | PCICLK3 (En/Dis) |
| Bit 2 | 11 | 1 | PCICLK2 (En/Dis) |
| Bit 1 | 10 | 1 | PCICLK1 (En/Dis) |
| Bit 0 | 8 | 1 | PCICLK0 (En/Dis) |

Byte 3: Active/Inactive Register (1 = enable, 0 = disable)

| Bit | Pin \# | PWD | Description |
| :---: | :---: | :---: | :--- |
| Bit 7 | - | 1 | (Reserved) |
| Bit 6 | - | 0 | (Reserved) |
| Bit 5 | - | 0 | (Reserved) |
| Bit 4 | - | 0 | (Reserved) |
| Bit 3 | 28 | 1 | SDRAM7 (En/Dis) |
| Bit 2 | 29 | 1 | SDRAM6 (En/Dis) |
| Bit 1 | 31 | 1 | SDRAM5 (En/Dis) |
| Bit 0 | 32 | 1 | SDRAM4 (En/Dis) |

## Notes:

1. Inactive means outputs are held LOW and are disabled from switching.
2. Latched register values will be inverted from pin values. Default latch condition is for all latched inputs to be floating (pulled up via internal resistor) at power-up.

Byte 4: Active/Inactive Register (1 = enable, $0=$ disable)

| Bit | Pin \# | PWD | Description |
| :---: | :---: | :---: | :--- |
| Bit 7 | - | 1 | (Reserved) |
| Bit 6 | - | 0 | (Reserved) |
| Bit 5 | - | 0 | (SEL24_48)\# |
| Bit 4 | - | 0 | Latched FS0\# |
| Bit 3 | - | 0 | Latched FS1\# |
| Bit 2 | - | 0 | Latched FS2\# |
| Bit 1 | - | 0 | Latched FS3\# |
| Bit 0 | - | 1 | (Reserved) |

Byte 5: Active/Inactive Register (1 = enable, $0=$ disable)

| Bit | Pin \# | PWD | Description |
| :---: | :---: | :---: | :--- |
| Bit 7 | 34 | 1 | SDRAM3 (En/Dis) |
| Bit 6 | 35 | 1 | SDRAM2 (En/Dis) |
| Bit 5 | 37 | 1 | SDRAM1 (En/Dis) |
| Bit 4 | 38 | 1 | SDRAM0 (En/Dis) |
| Bit 3 | 26 | 1 | 48 MHz (En/Dis) |
| Bit 2 | 25 | 1 | $24 M H z ~(E n / D i s) ~$ |
| Bit 1 | 48 | 1 | REF1 (En/Dis) |
| Bit 0 | 2 | 1 | REF0 (En/Dis) |

## Notes:

1. Inactive means outputs are held LOW and are disabled from switching.
2. Latched register values will be inverted from pin values. Default latch condition is for all latched inputs to be floating (pulled up via internal resistor) at power-up.

Absolute Maximum Ratings
Supply Voltage . . . . . . . . . . . . . . . . . . . . . 5.5 V
Logic Inputs . . . . . . . . . . . . . . . . . . . . GND -0.5 V to $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$
Ambient Operating Temperature . . . . . . . . . V
CaseTemperature . . . . . . . . . . . . . . $115^{\circ} \mathrm{C}$
Storage Temperature . . . . . . . . . . . . . . . $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

## Electrical Characteristics - Input/Supply/Common Output Parameters

## General $I^{2} C$ serial interface information

The information in this section assumes familiarity with $I^{2} \mathrm{C}$ programming.
For more information, contact ICS for an $I^{2} \mathrm{C}$ programming application note.

## How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D2 ${ }_{\text {(H) }}$
- ICS clock will acknowledge
- Controller (host) sends a dummy command code
- ICS clock will acknowledge
- Controller (host) sends a dummy byte count
- ICS clock will acknowledge
- Controller (host) starts sending first byte (Byte 0) through byte 5
- ICS clock will acknowledge each byte one at a time.
- Controller (host) sends a Stop bit

| How to Write: |  |
| :---: | :---: |
| Controller (Host) | ICS (Slave/Receiver) |
| Start Bit |  |
| Address D2 ${ }_{(H)}$ |  |
|  | ACK |
| Dummy Command Code |  |
|  | ACK |
| Dummy Byte Count |  |
|  | ACK |
| Byte 0 |  |
|  | ACK |
| Byte 1 |  |
|  | ACK |
| Byte 2 |  |
|  | ACK |
| Byte 3 |  |
|  | ACK |
| Byte 4 |  |
|  | ACK |
| Byte 5 |  |
|  | ACK |
| Stop Bit |  |

## How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the read address D3 ${ }_{\text {(H) }}$
- ICS clock will acknowledge
- ICS clock will send the byte count
- Controller (host) acknowledges
- ICS clock sends first byte (Byte 0) through byte 5
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

| How to Read: |  |
| :---: | :---: |
| Controller (Host) | ICS (Slave/Receiver) |
| Start Bit |  |
| Address $_{\text {D3 }_{(\text {H })}}$ |  |
|  | ACK |
| ACK | Byte Count |
|  | Byte 0 |
| ACK | Byte 1 |
|  | Byte 2 |
| ACK |  |
| ACK | Byte 3 |
|  | Byte 4 |
| ACK |  |
|  | Byte 5 |
| ACK |  |
| ACK |  |
| Stop Bit |  |

## Notes:

1. The ICS clock generator is a slave/receiver, $I^{2} \mathrm{C}$ component. It can read back the data stored in the latches for verification. Read-Back will support Intel PII/PIII "Block-Read" protocol.
2. The data transfer rate supported by this clock generator is 100 K bits/sec or less (standard mode)
3. The input is operating at 3.3 V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator $I^{2} \mathrm{C}$ interface, the protocol is set to use only "Block-Writes" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

0375E-12/15/08

## ICS9248-195

## Shared Pin Operation Input/Output Pins

The I/O pins designated by (input/output) serve as dual signal functions to the device. During initial power-up, they act as input pins. The logic level (voltage) that is present on these pins at this time is read and stored into a 5-bit internal data latch. At the end of Power-On reset, (see AC characteristics for timing values), the device changes the mode of operations for these pins to an output function. In this mode the pins produce the specified buffered clocks to external loads.

To program (load) the internal configuration register for these pins, a resistor is connected to either the VDD (logic 1) power supply or the GND (logic 0) voltage potential. A 10 Kilohm (10K) resistor is used to provide both the solid CMOS programming voltage needed during the power-up programming period and to provide an insignificant load on the output clock during the subsequent operating period.

Figure 1 shows a means of implementing this function when a switch or 2 pin header is used. With no jumper is installed the pin will be pulled high. With the jumper in place the pin will be pulled low. If programmability is not necessary, than only a single resistor is necessary. The programming resistors should be located close to the series termination resistor to minimize the current loop area. It is more important to locate the series termination resistor close to the driver than the programming resistor.

Fig. 1

## PD\# Timing Diagram

The power down selection is used to put the part into a very low power state without turning off the power to the part. PD\# is an asynchronous active low input. This signal needs to be synchronized internal to the device prior to powering down the clock synthesizer.

Internal clocks are not running after the device is put in power down. When PD\# is active low all clocks need to be driven to a low value and held prior to turning off the VCOs and crystal. The power up latency needs to be less than 4 mS . The power down latency should be as short as possible but conforming to the sequence requirements shown below. PCI_STOP\# and CLK_STOP\# are considered to be don't cares during the power down operations. The REF and 48MHz clocks are expected to be stopped in the LOW state as soon as possible. Due to the state of the internal logic, stopping and holding the REF clock outputs in the LOW state may require more than one clock cycle to complete.

## Notes:

1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248 device).
2. As shown, the outputs Stop Low on the next falling edge after PD\# goes low.
3. PD\# is an asynchronous input and metastable conditions may exist. This signal is synchronized inside this part.
4. The shaded sections on the VCO and the Crystal signals indicate an active clock.
5. Diagrams shown with respect to 133 MHz . Similar operation when CPU is 100 MHz .

## CLK_STOP\# Timing Diagram

CLK_STOP\# is an asychronous input to the clock synthesizer. It is used to turn off the CPU clocks for low power operation. CLK_STOP\# is synchronized by the ICS9248-195. The minimum that the CPU clock is enabled (CLK_STOP\# high pulse) is 100 CPU clocks. All other clocks will continue to run while the CPU clocks are disabled. The CPU clocks will always be stopped in a low state and start in such a manner that guarantees the high pulse width is a full pulse. CPU clock on latency is less than 4 CPU clocks and CPU clock off latency is less than 4 CPU clocks.

## Notes:

1. All timing is referenced to the internal CPU clock.
2. CLK_STOP\# is an asynchronous input and metastable conditions may exist. This signal is synchronized to the CPU clocks inside the ICS9248-195.
3. SDRAM-F output is controlled by Buffer in signal, not affected by the ICS9248-195 CLK_STOP\# signal. SDRAM are controlled as shown.
4. All other clocks continue to run undisturbed.

## PCI_STOP\# Timing Diagram

PCI_STOP\# is an asynchronous input to the ICS9248-195. It is used to turn off the PCICLK clocks for low power operation. PCI_STOP\# is synchronized by the ICS9248-195 internally. The minimum that the PCICLK clocks are enabled ( PCI _STOP\# high pulse) is at least 10 PCICLK clocks. PCICLK clocks are stopped in a low state and started with a full high pulse width guaranteed. PCICLK clock on latency cycles are only three rising PCICLK clocks, off latency is one PCICLK clock.

## Notes:

1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248 device.)
2. PCI_STOP\# is an asynchronous input, and metastable conditions may exist. This signal is required to be synchronized inside the ICS9248.
3. All other clocks continue to run undisturbed.
4. CLK_STOP\# is shown in a high (true) state.
